Home Training app · screens

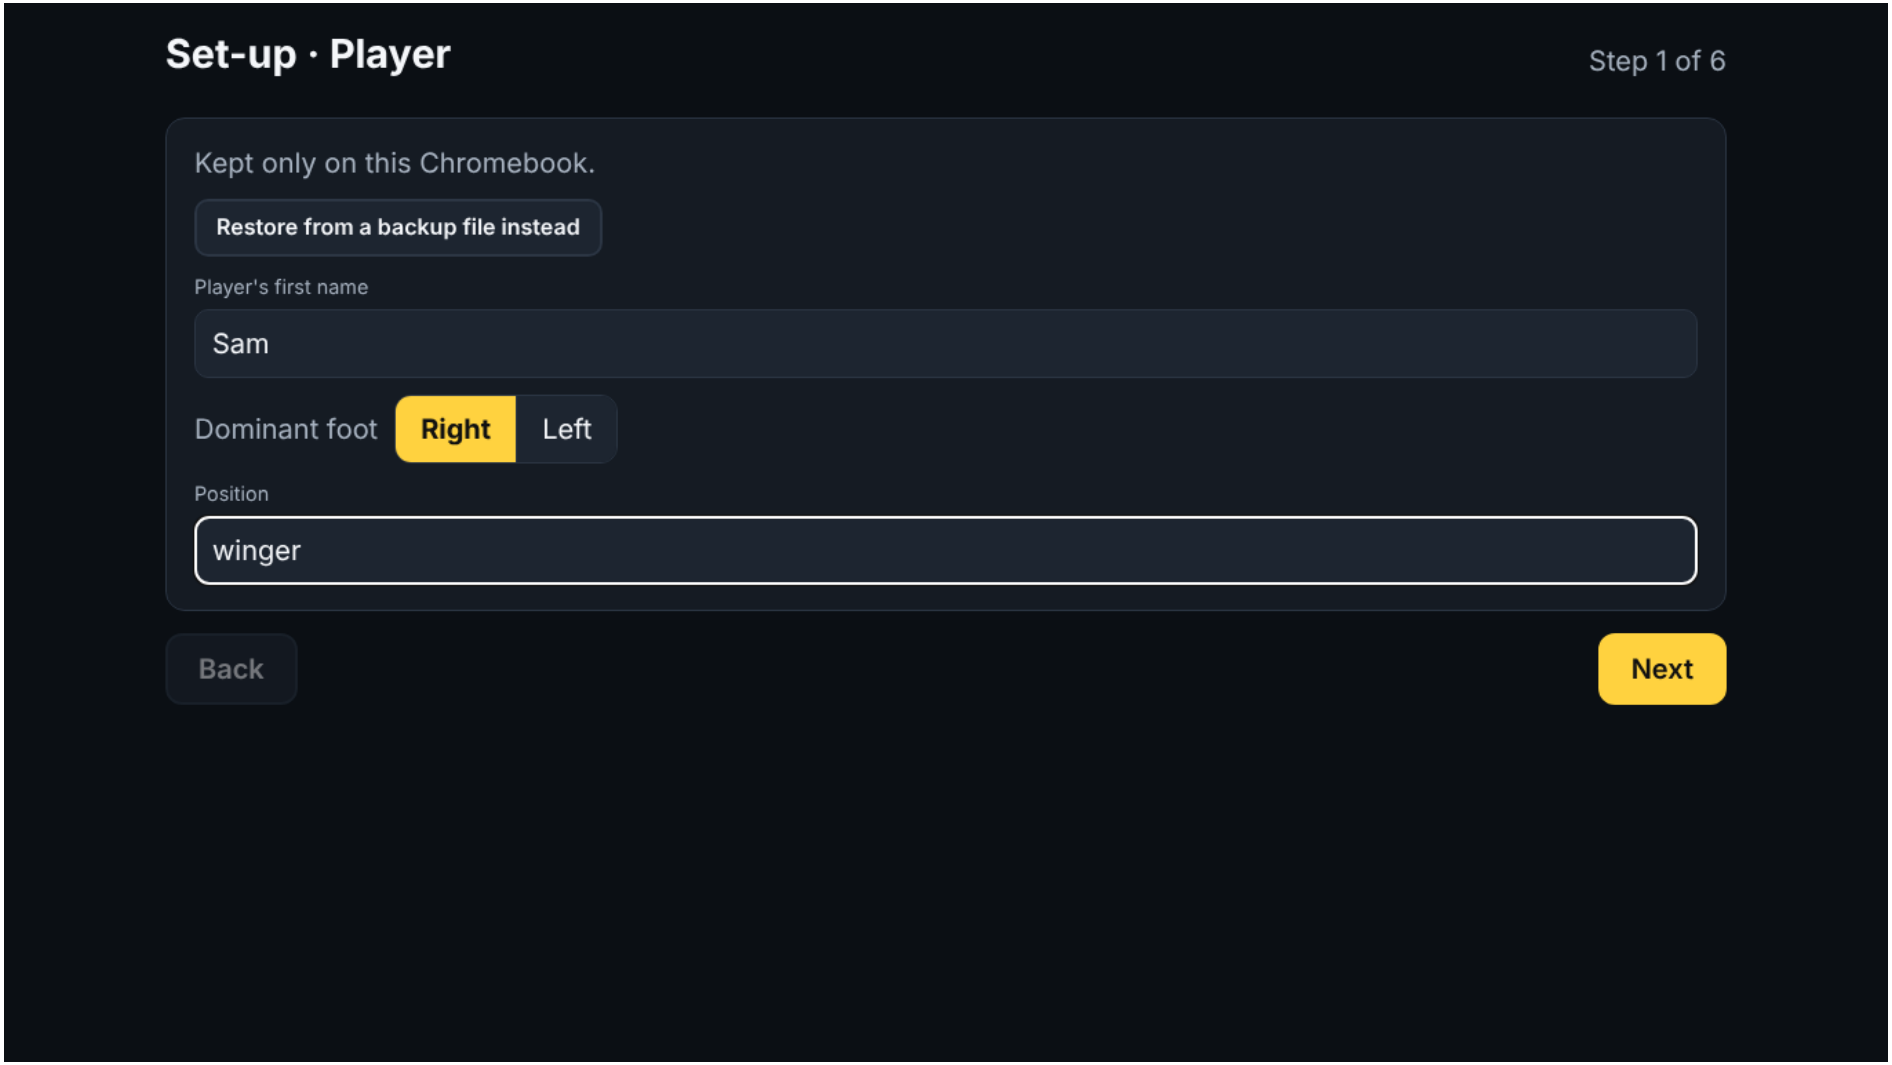

What each screen is for. The app is a personal soccer-training web app for one player on a Chromebook, run by a parent. The screens were captured from the real app on 2026-10-15 using fictional sample data (a player called "Sam"). The camera pictures are Chromium's test video, not a person, and the feint scorecard shows sample numbers.

Section	Screens
First-run set-up	Set-up · Player, Set-up · Room, Set-up · Priorities, Set-up · Demonstrations, Set-up · Backup and PIN
Home	Home screen
A training session	Countdown, Warm-up, Demonstration view, Practice view, Paused, End-of-drill card (practice block), Decision D10: the card starts blank, never pre-filled from an earlier session. Each number is one tap (0–10), and Confirm stays disabled until everything is entered. The pill shows the layout version and cue level the result is compared under. The rubric item formerly called 'sell' is now 'fake'., End-of-drill card (benchmark), Session summary
Progress reporting	Progress · Week, Progress · Skills, Drill view · comparison picker, Drill view · improvement, Session builder
Cue drills	Coach · Cue drills, Coach · Cue drill editor, Cue · BIT, Cue · HELD, Cue · BLOCKED, Cue · arrow, Head-up numbers, Slalom benchmark · ready, Slalom benchmark · finish target
Camera and feint video evaluation	Camera set-up, Reference photo, Floor calibration, Zones and tripwire, Framing check, Recording a cue block, Clip player, Scorecard, flagged reps and review, Pose speed test
Plan update (parts 15–18)	Home · Start my session, Room profile · size, Room profile · anchors, Room profile · safe floor, Room profile · cone overlay, Defender block, Parent · 3D defender test (commit), Parent · 3D defender test (hold), Parent · Validation, Parent · Learning, Defender positions, Parent · Ball registration

First-run set-up — A parent completes these once. Nothing leaves the Chromebook.

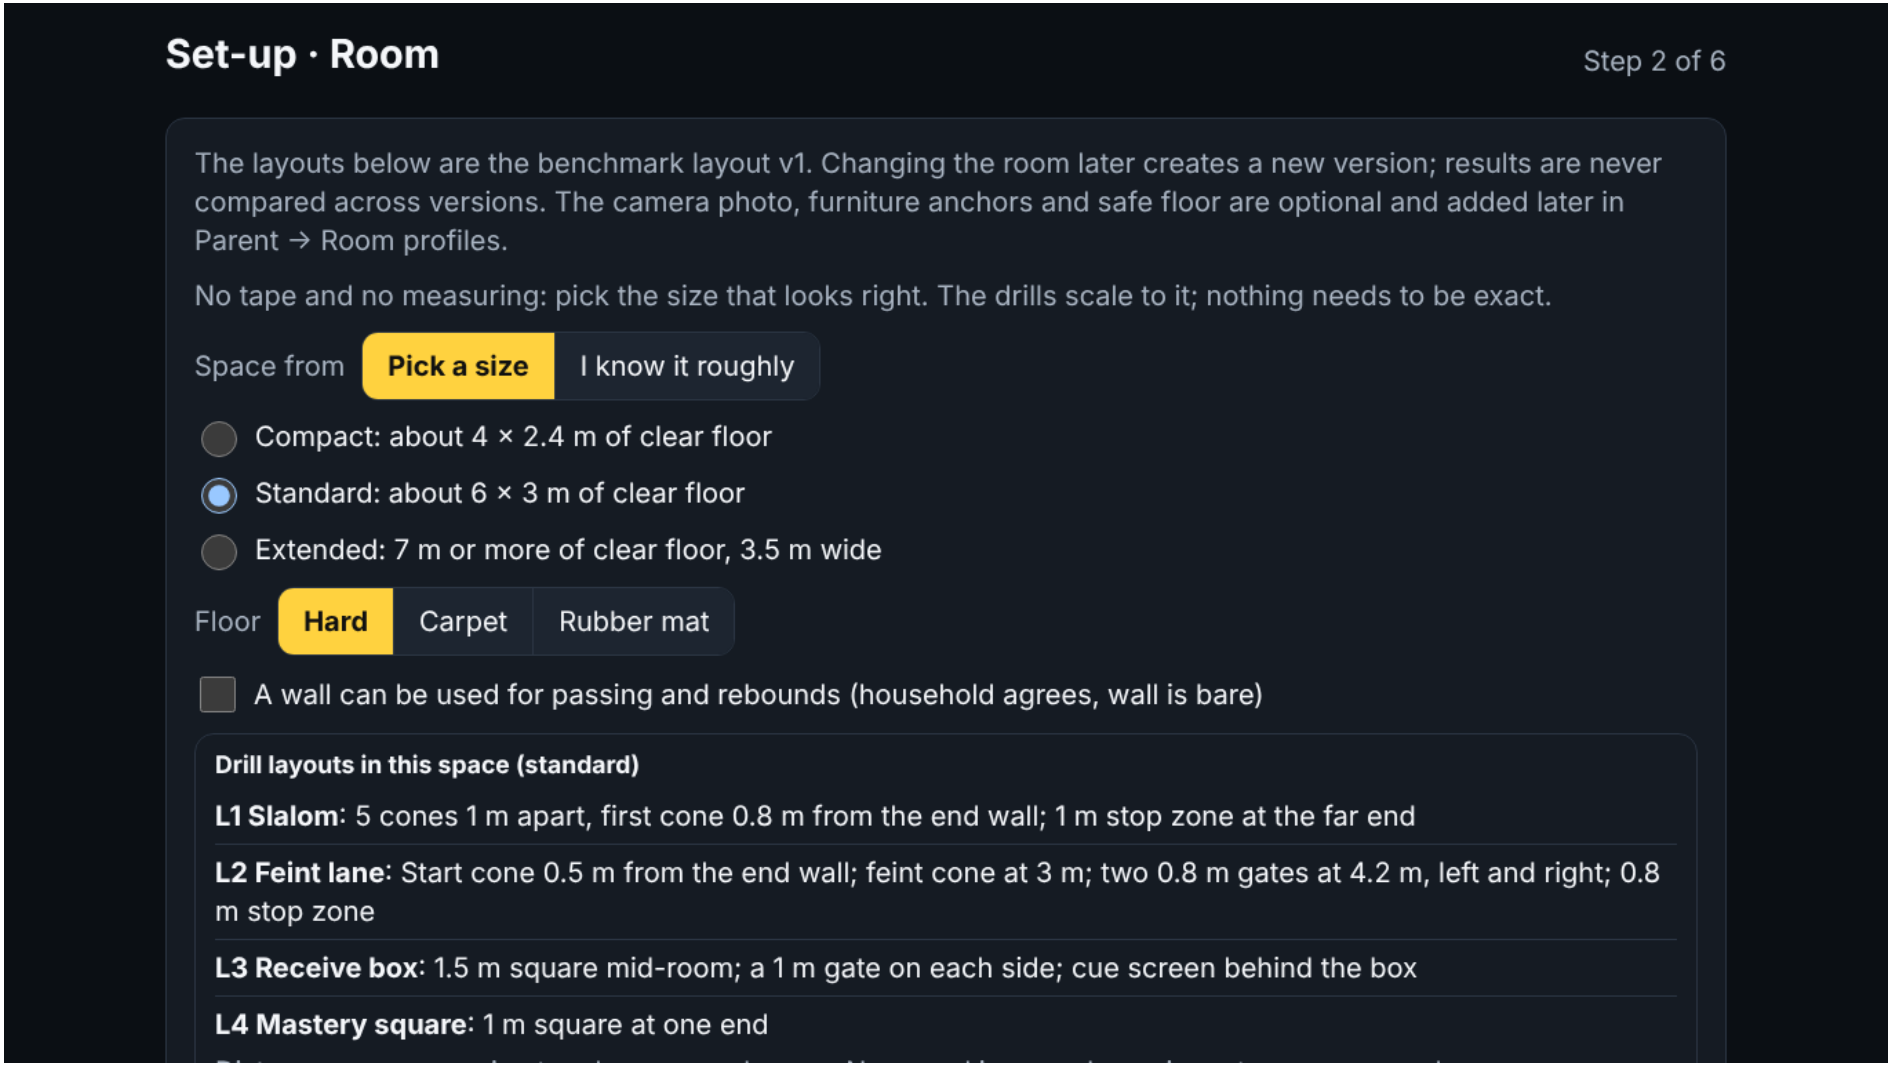

1. Set-up · Player

Records the player's first name, dominant foot and position. Data stays only in this browser on this Chromebook. On a new device, the small button restores everything from a backup file instead of starting over.

2. Set-up · Room

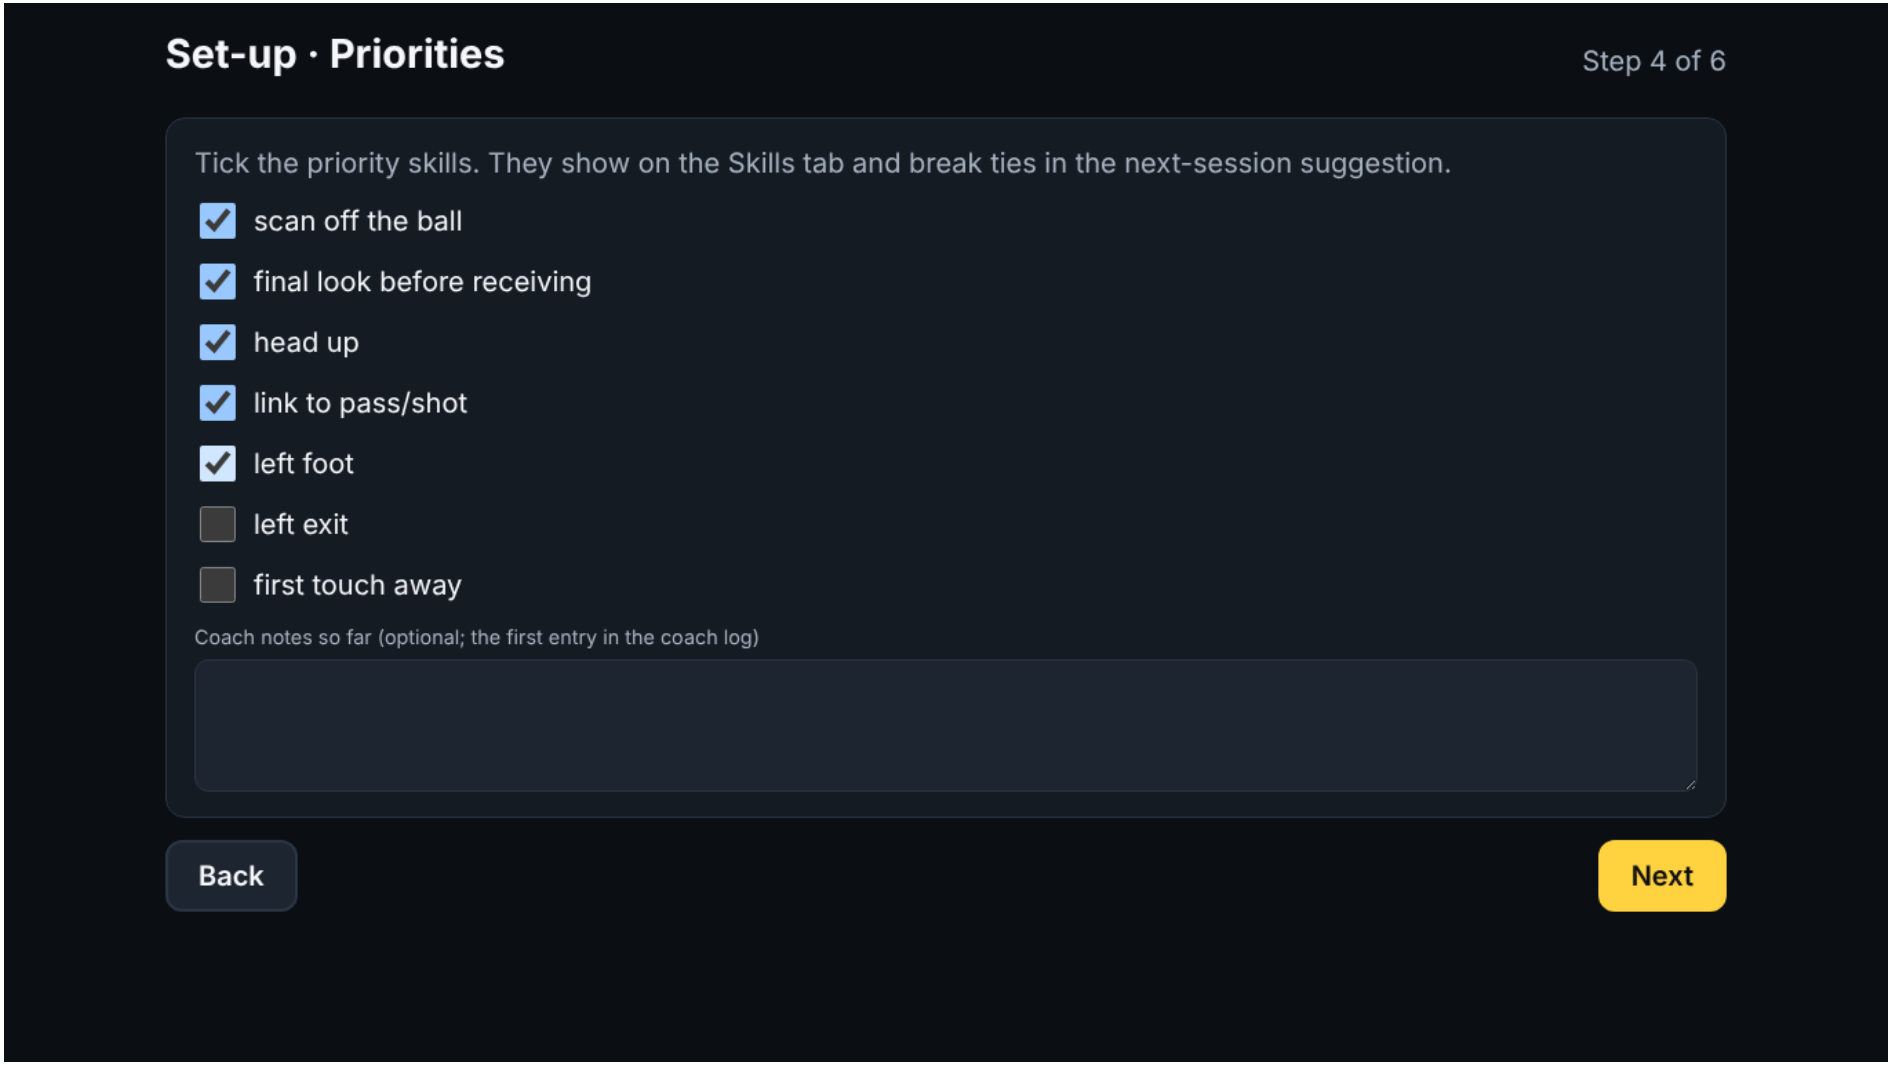

No tape and no measuring (decision D1): the parent picks a size (compact, standard, extended) or enters rough dimensions. The drill layouts follow, with fewer slalom cones in a smaller space rather than cramped spacing, and any layout that does not fit is marked unavailable. The camera photo, furniture anchors and safe floor come later in Parent → Room profiles.

First-run set-up

3. Set-up · Priorities

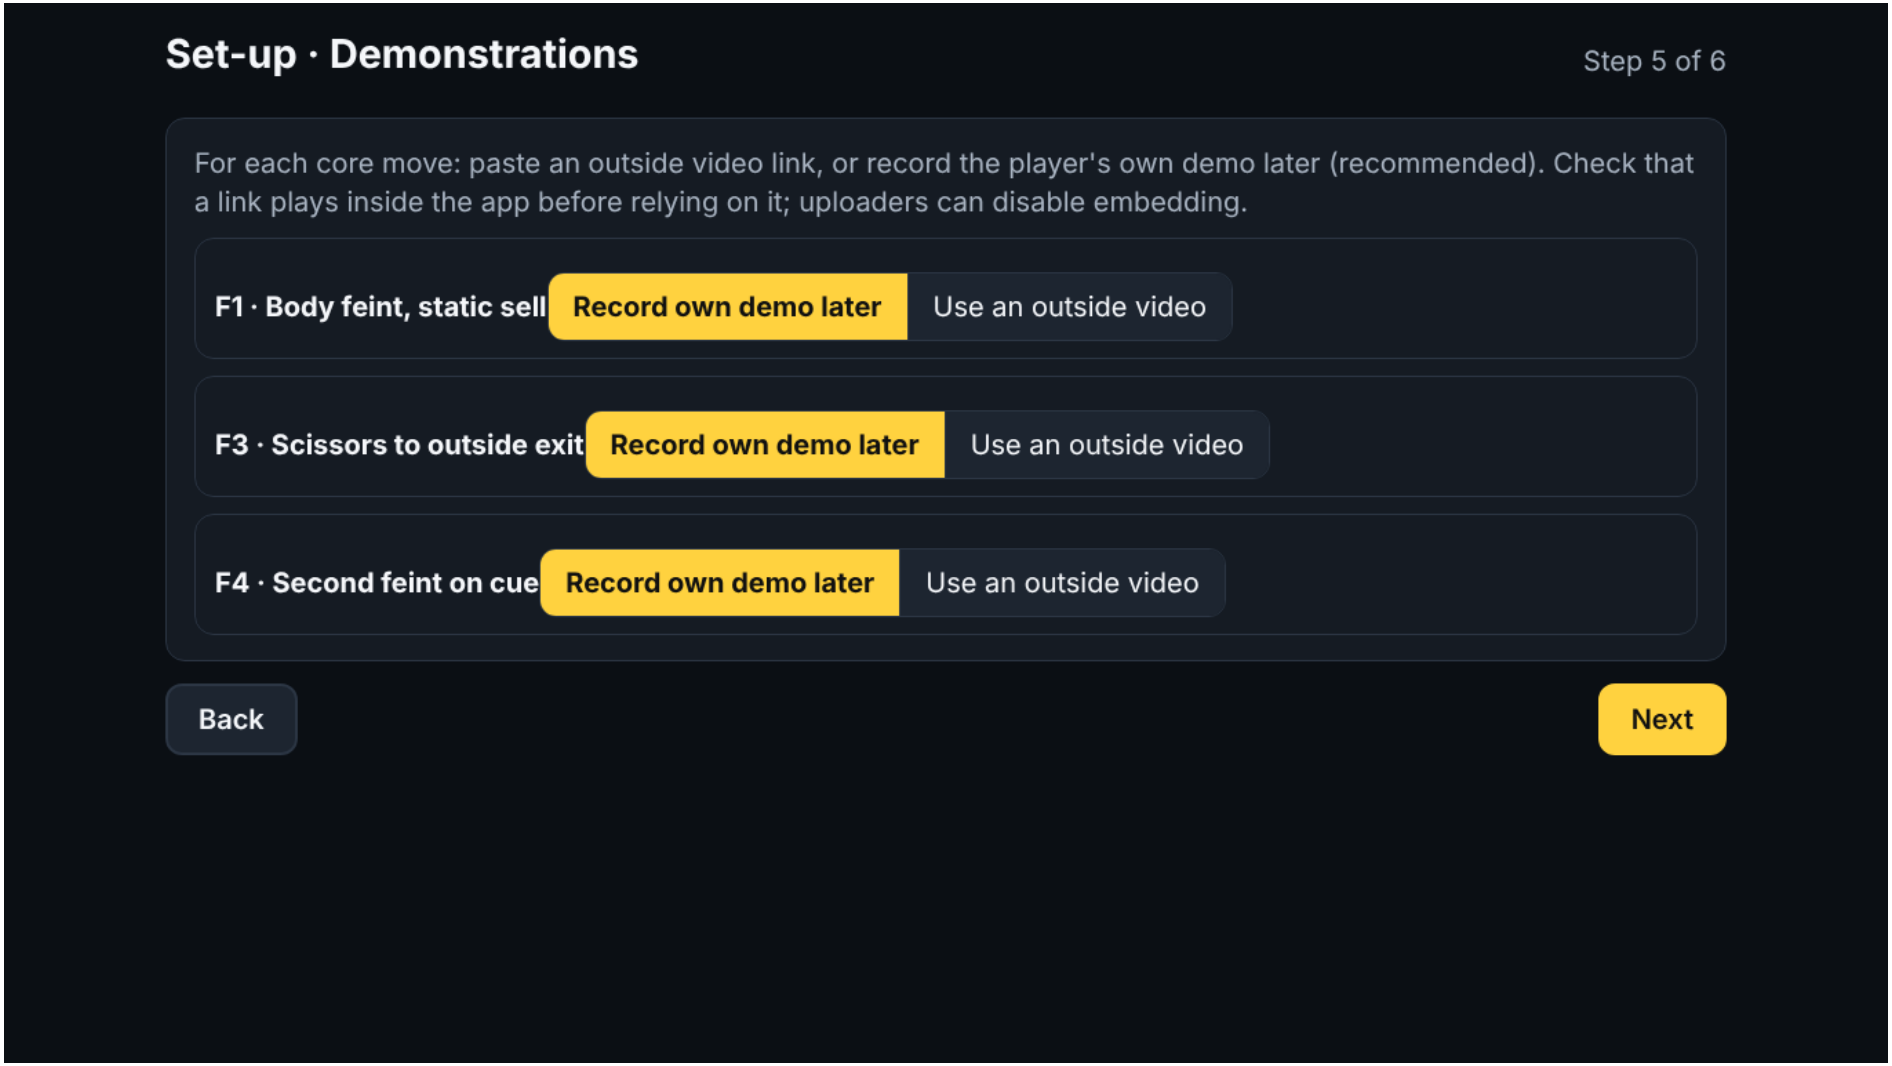

The coach's priority skills, pre-ticked from the assessment, plus the first coach note. Priorities tag areas on the Skills tab and break ties when the app suggests the next session.

First-run set-up

4. Set-up · Demonstrations

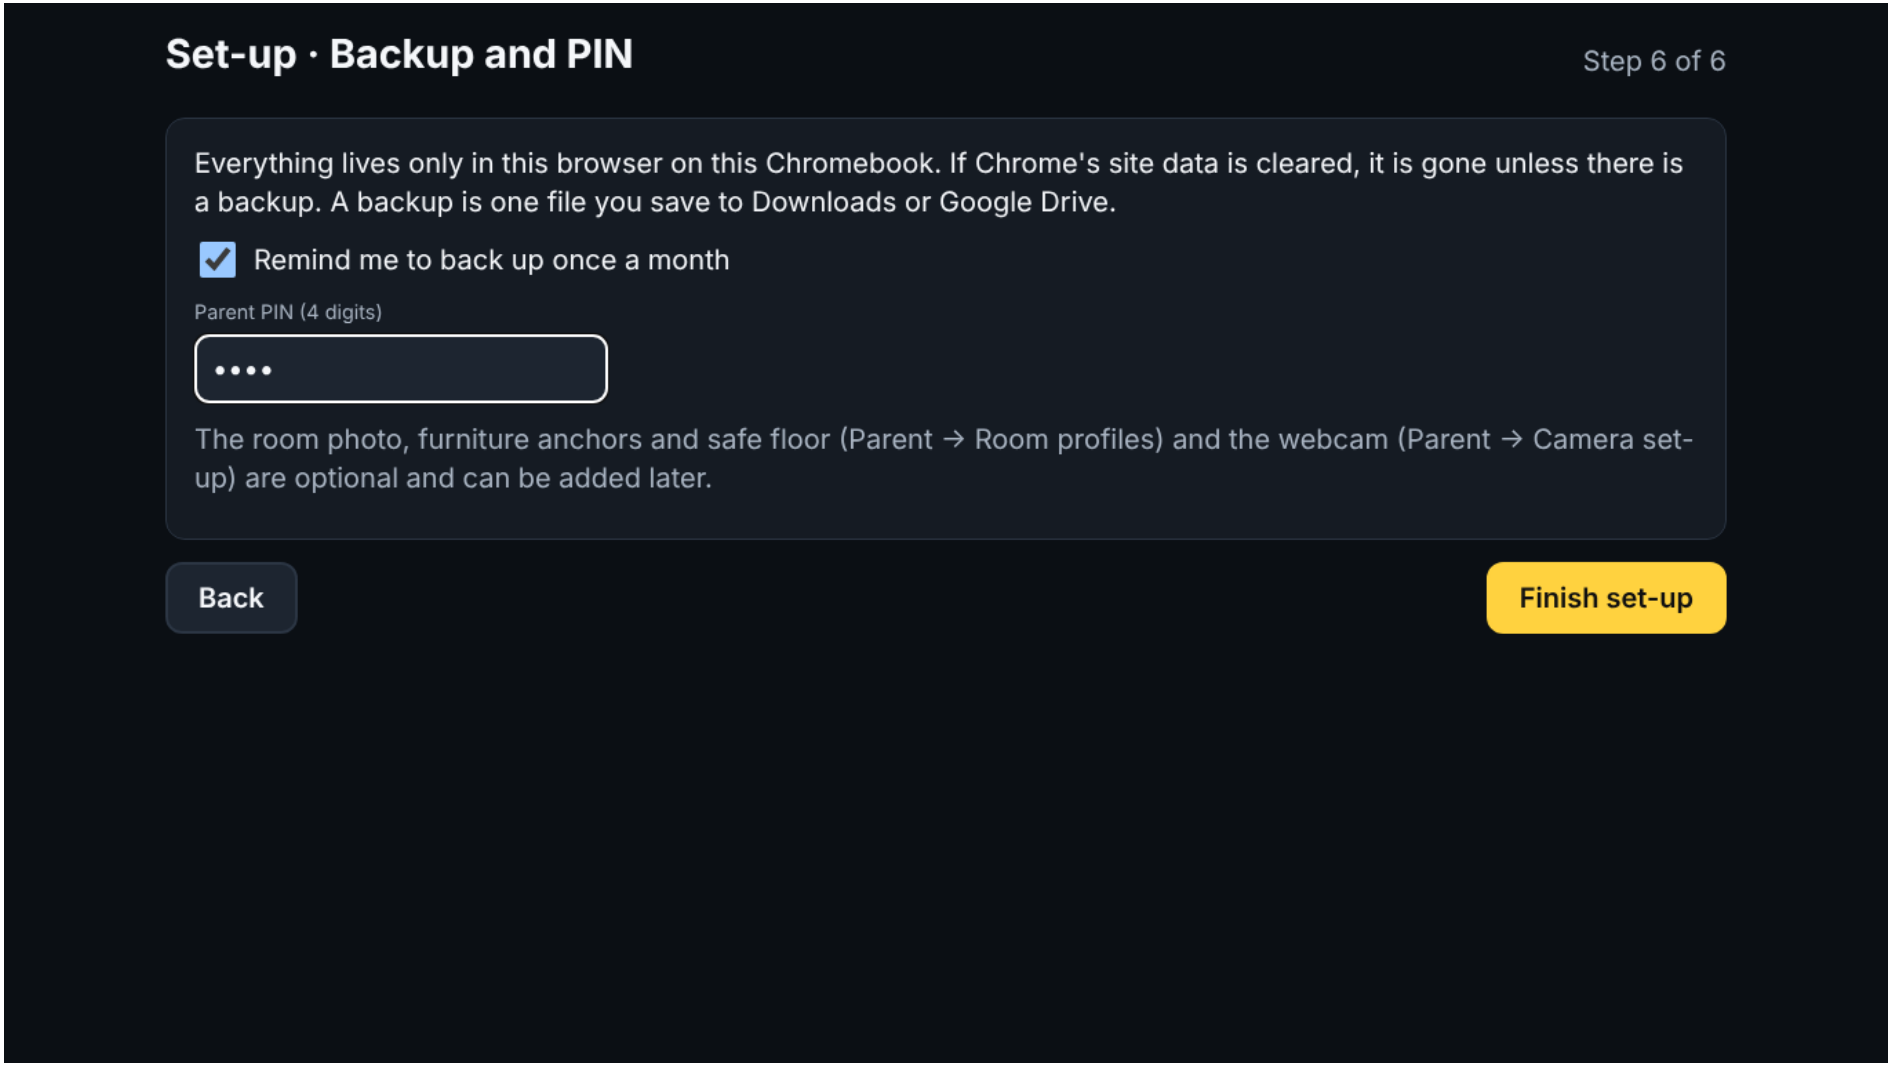

For each core move, choose to record the player's own demo later (recommended) or paste an outside YouTube link. No links are built in.

First-run set-up

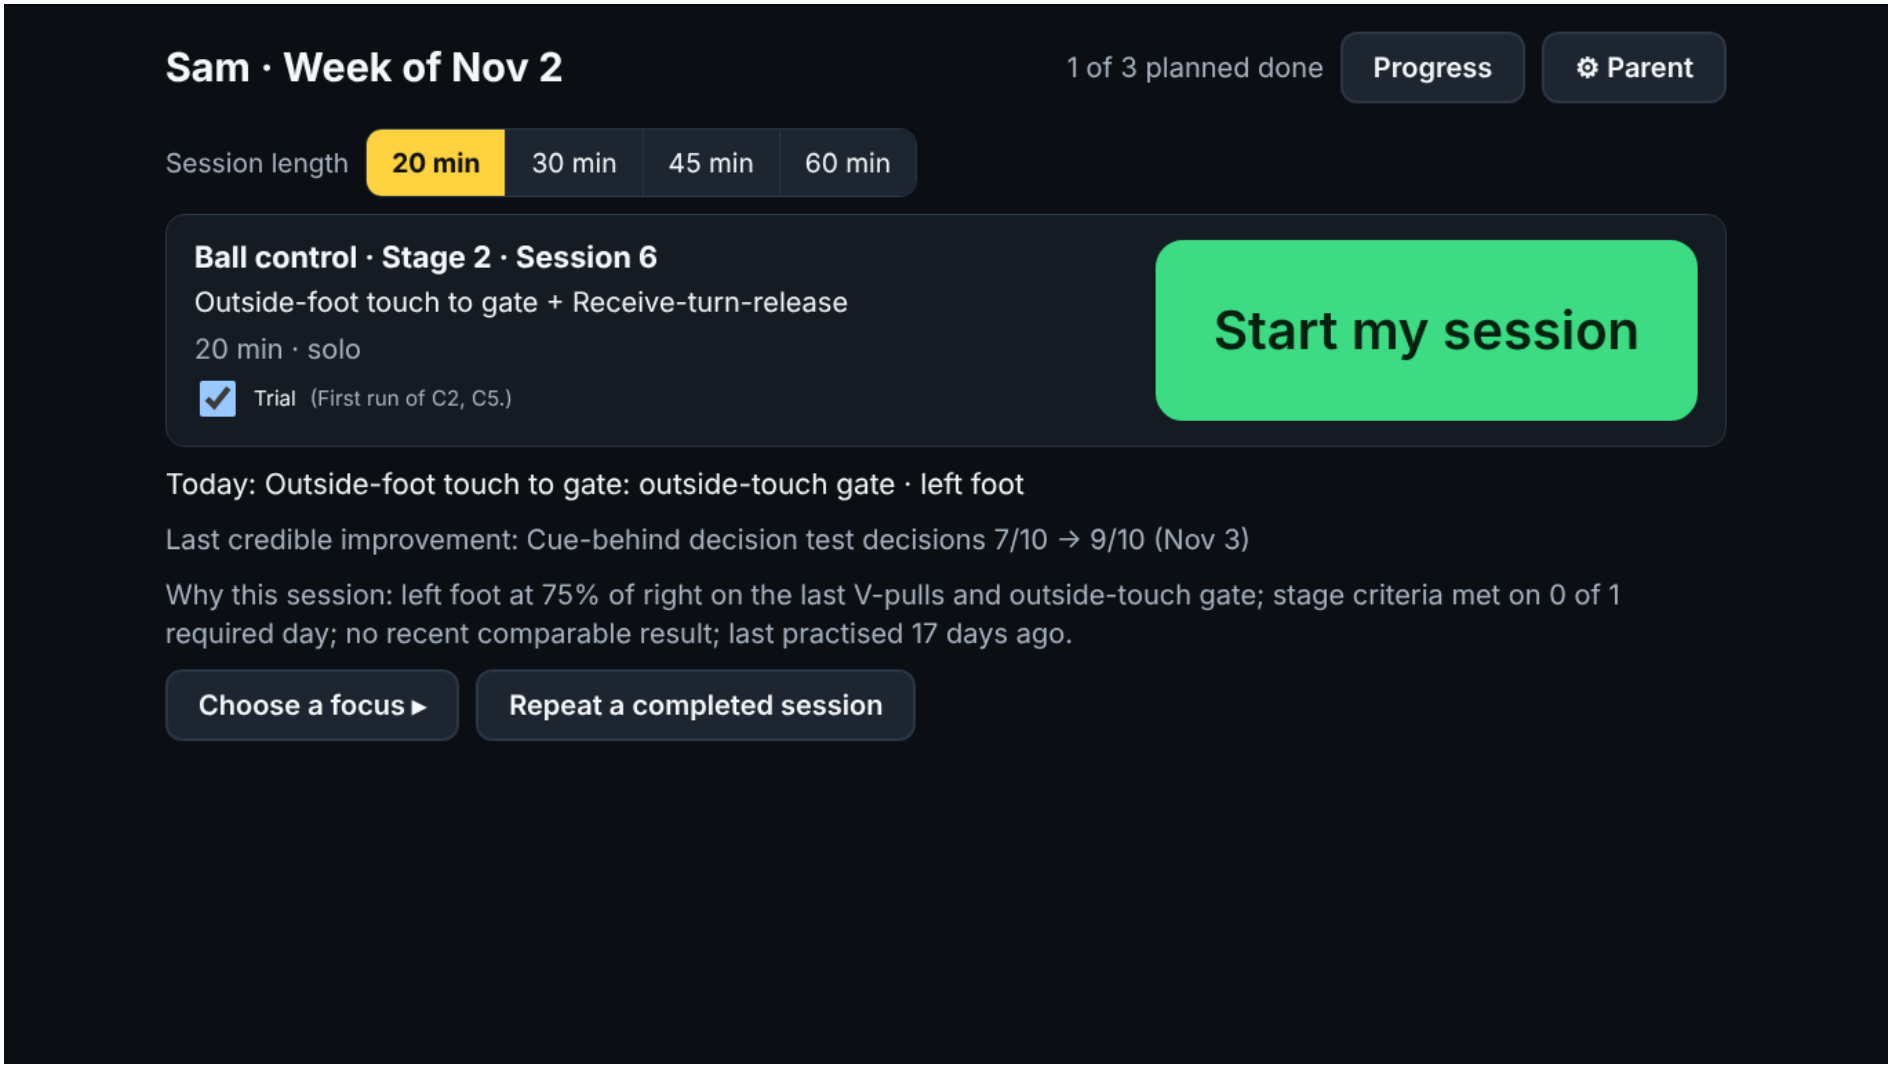

5. Set-up · Backup and PIN

Explains that all data is local, turns on the monthly backup reminder and sets the 4-digit parent PIN that protects parent and coach mode.

6. Home screen

Home screen with sample history (decision D14): Start my session at 20, 30, 45 or 60 minutes, today's one or two goals from the drill's focus measures, the last credible improvement, and why this session was suggested. Other areas, the builder, quiz, anchor check and the optional scanning diagnostic sit behind 'Choose a focus'.

A training session — Feinting Session 8, captured on a fast-forwarded clock. Everything inside a block is also spoken, so the player never needs to touch the screen.

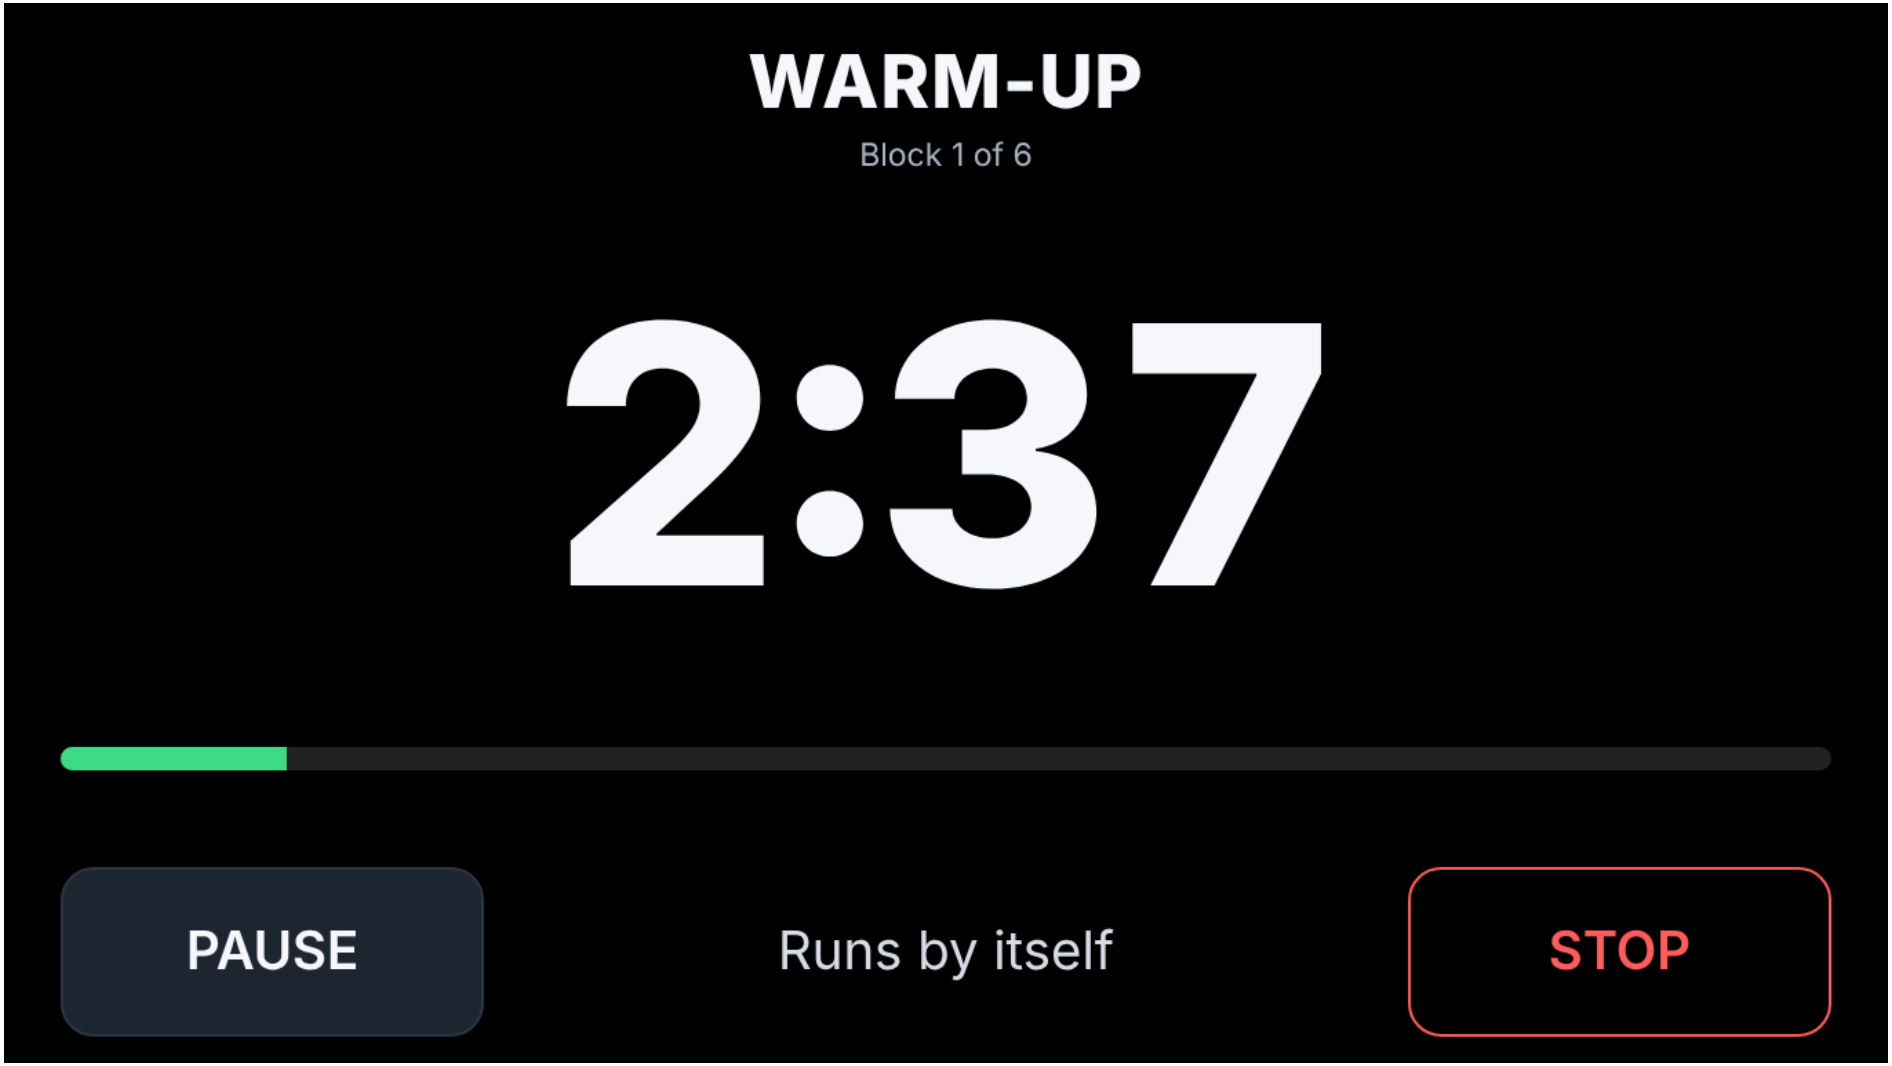

7. Countdown

A spoken 10-second countdown gives the player time to walk to the start cone. PAUSE and STOP are always available.

8. Warm-up

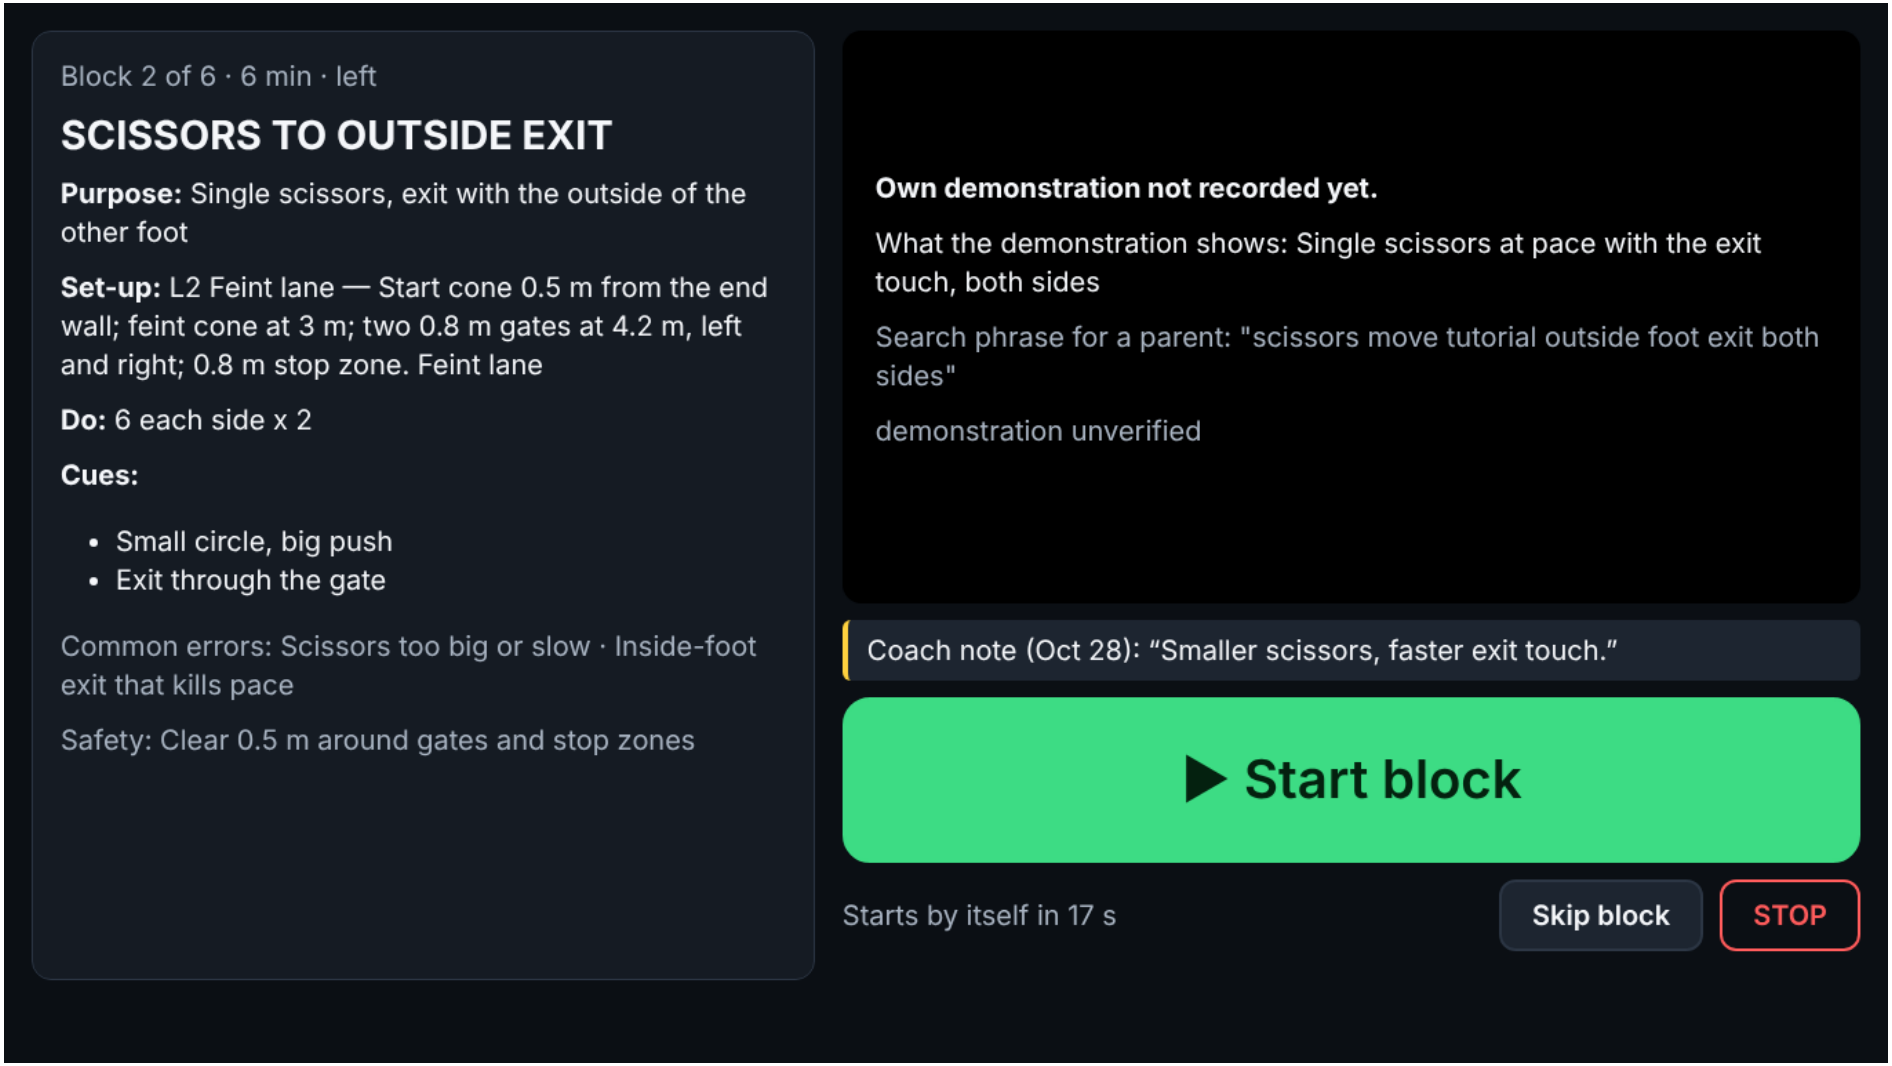

The warm-up runs by itself and each step is announced. Timed blocks have no DONE button, so they cannot be cut short by accident.

A training session

9. Demonstration view

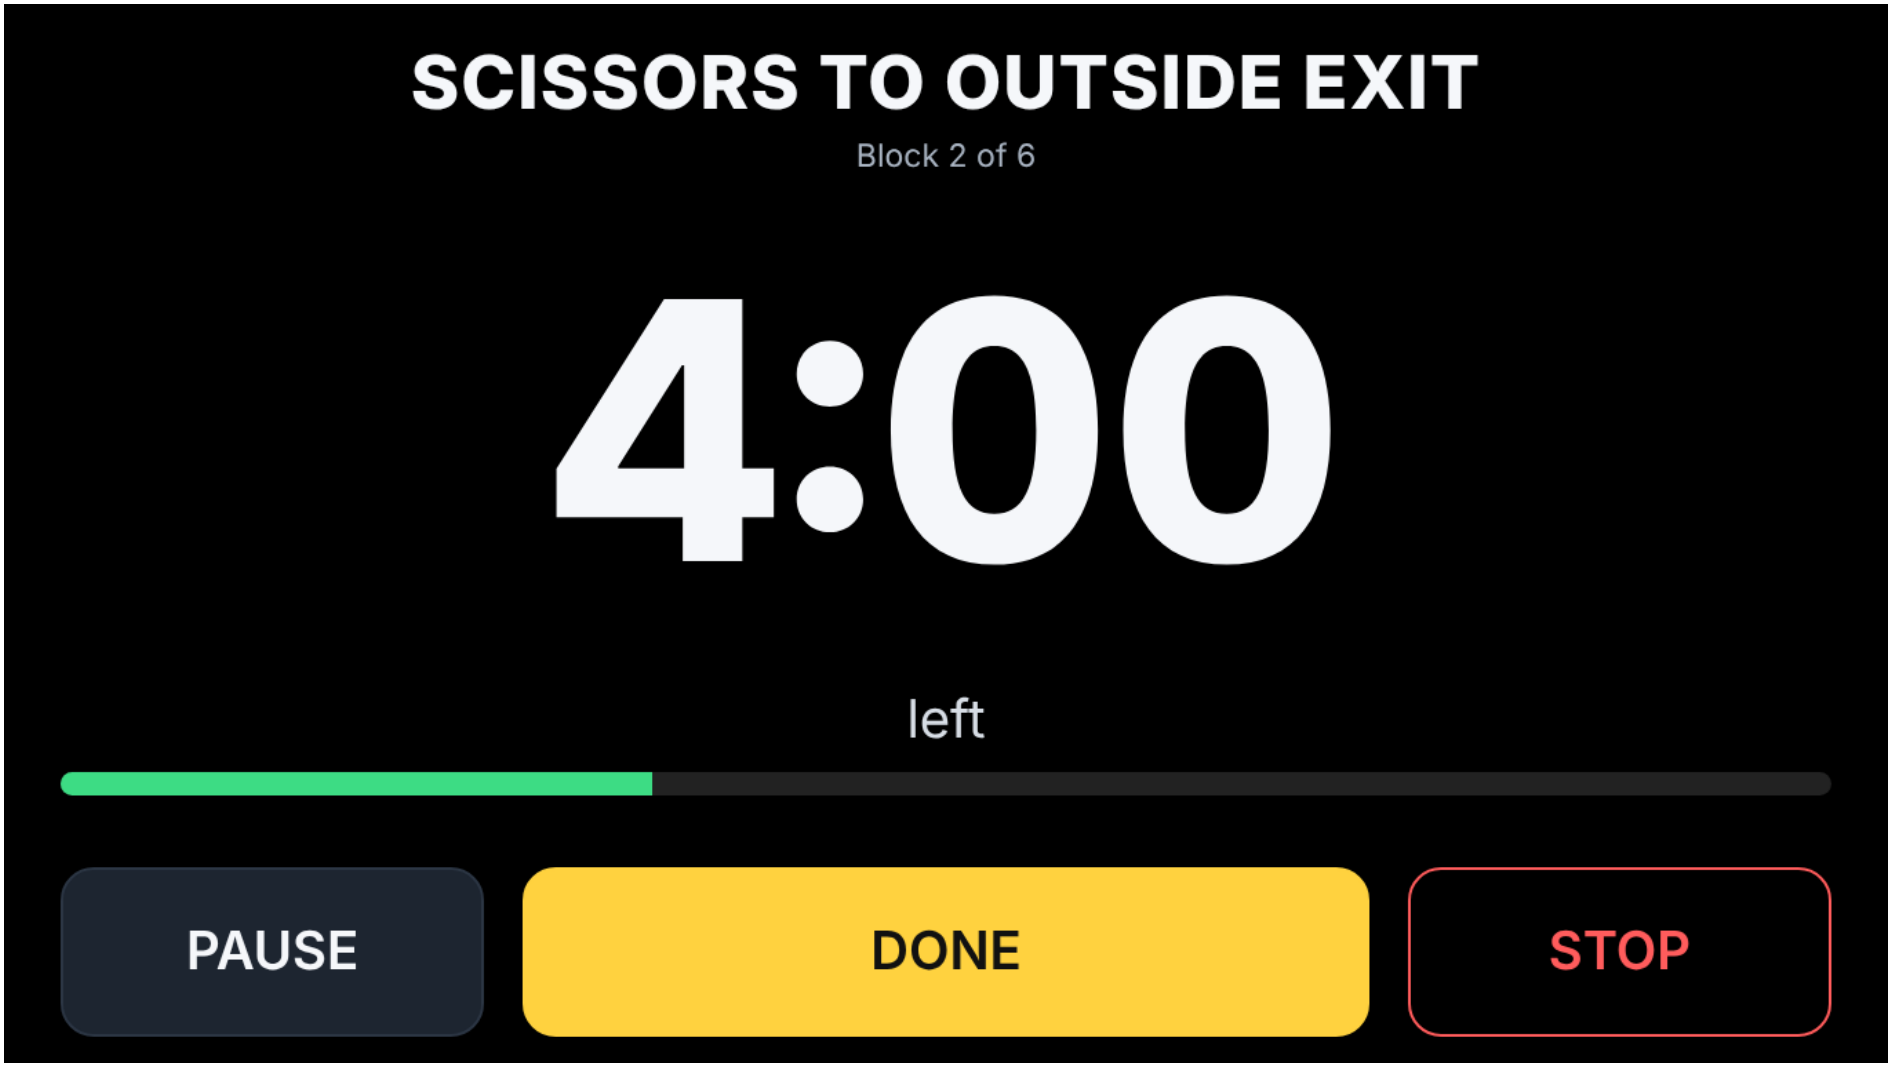

Before each drill: purpose, set-up using this room's dimensions, what to do, cues, common errors and safety. On the right is the demonstration (an own clip or YouTube, with a fallback when it can't play) and any open coach note for this drill. One tap starts the block, and it starts by itself after 20 seconds unless a video is playing.

A training session

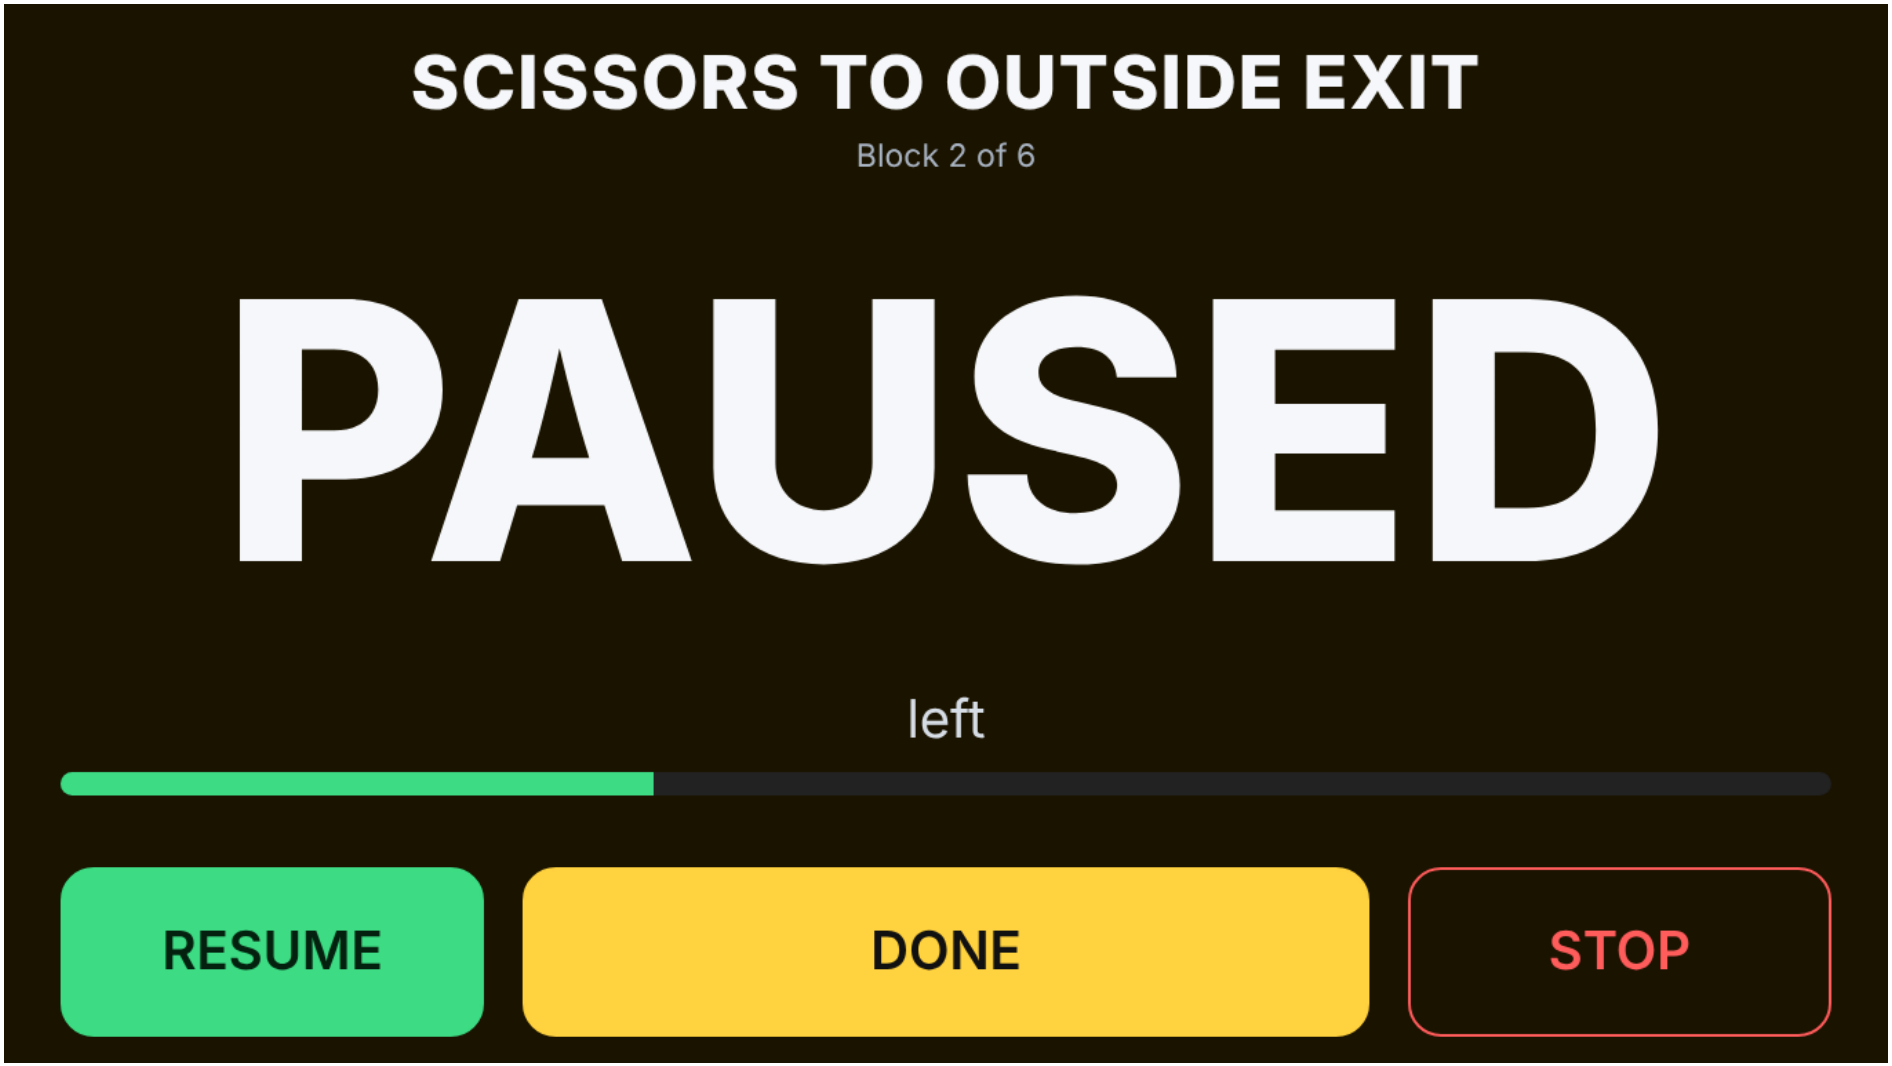

10. Practice view

Readable from 5 m: drill name, a clock about a third of the screen high, the block number and a progress bar. Rep-based drills show DONE, which counts once at least 80% of the block has run.

11. Paused

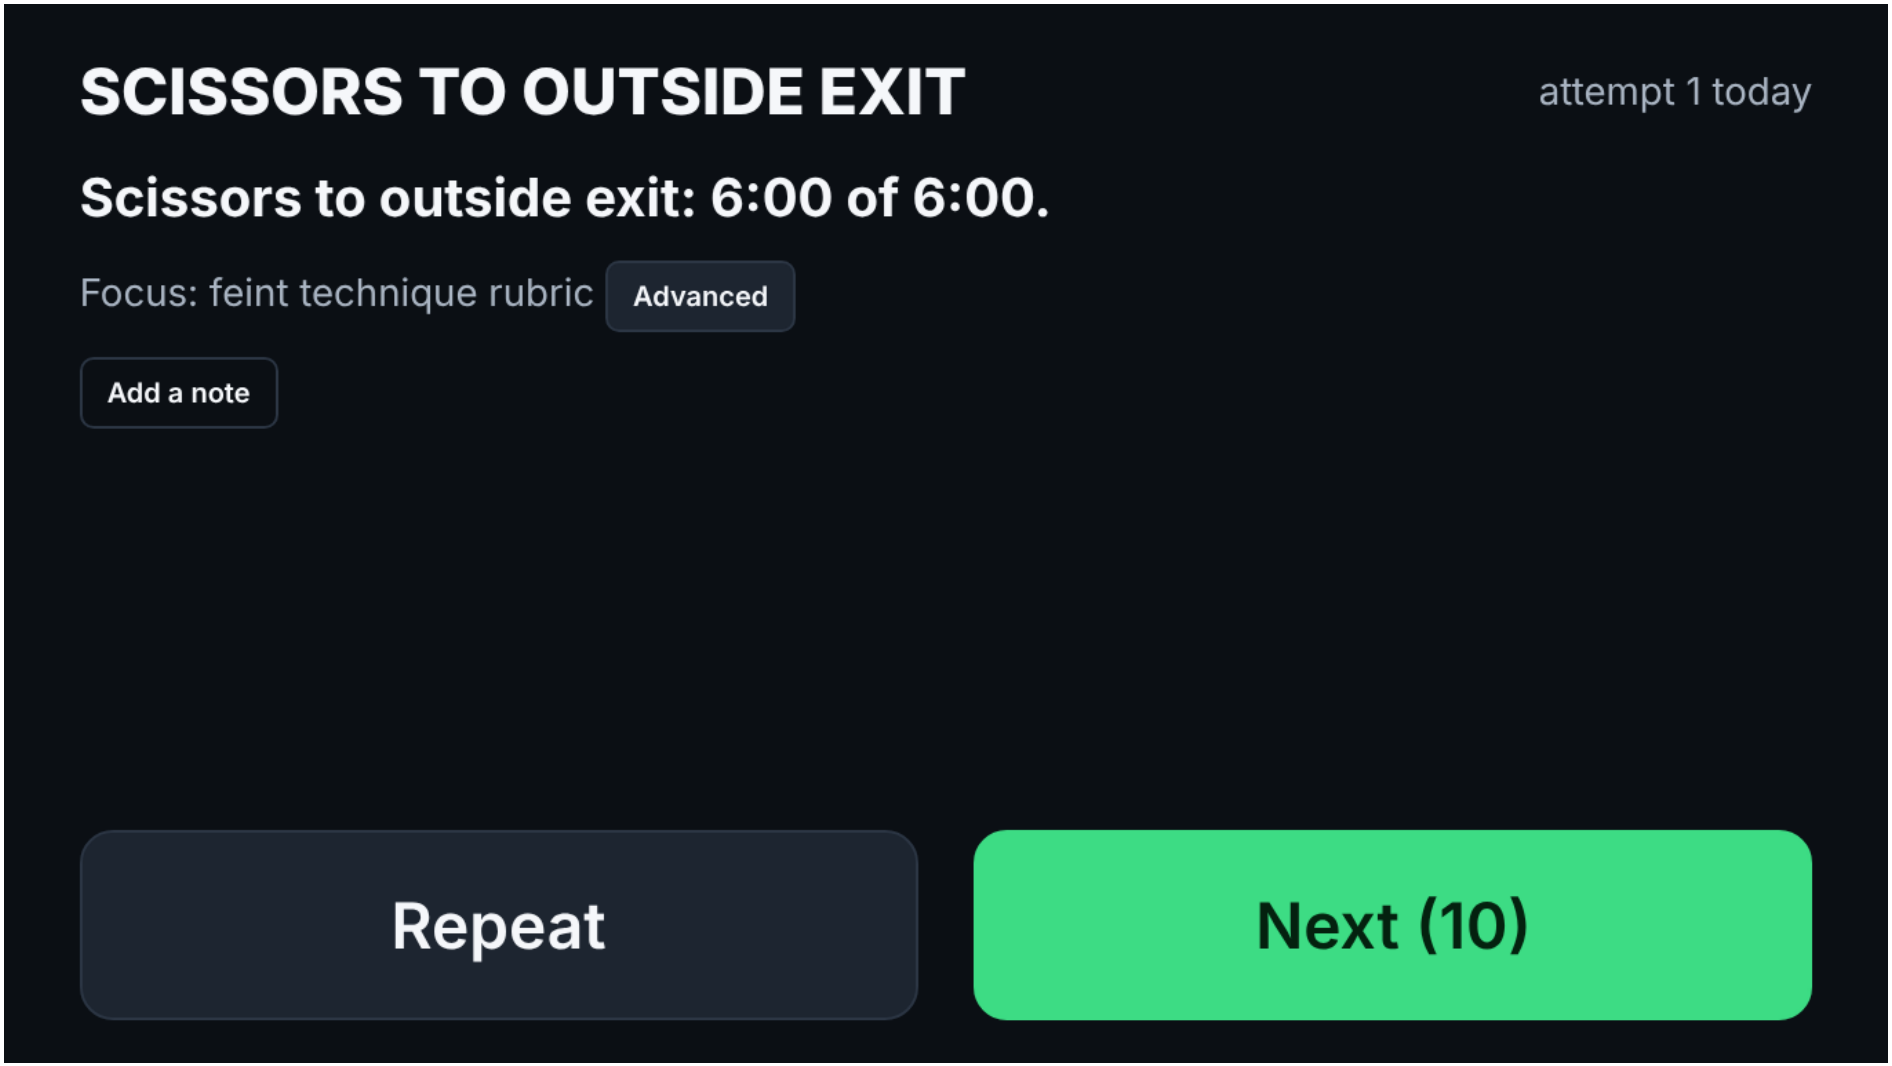

PAUSE freezes the block clock. Pauses are allowed, but a single pause over 5 minutes, or pauses adding up to a quarter of the session, makes the session partial.

A training session

12. End-of-drill card (practice block)

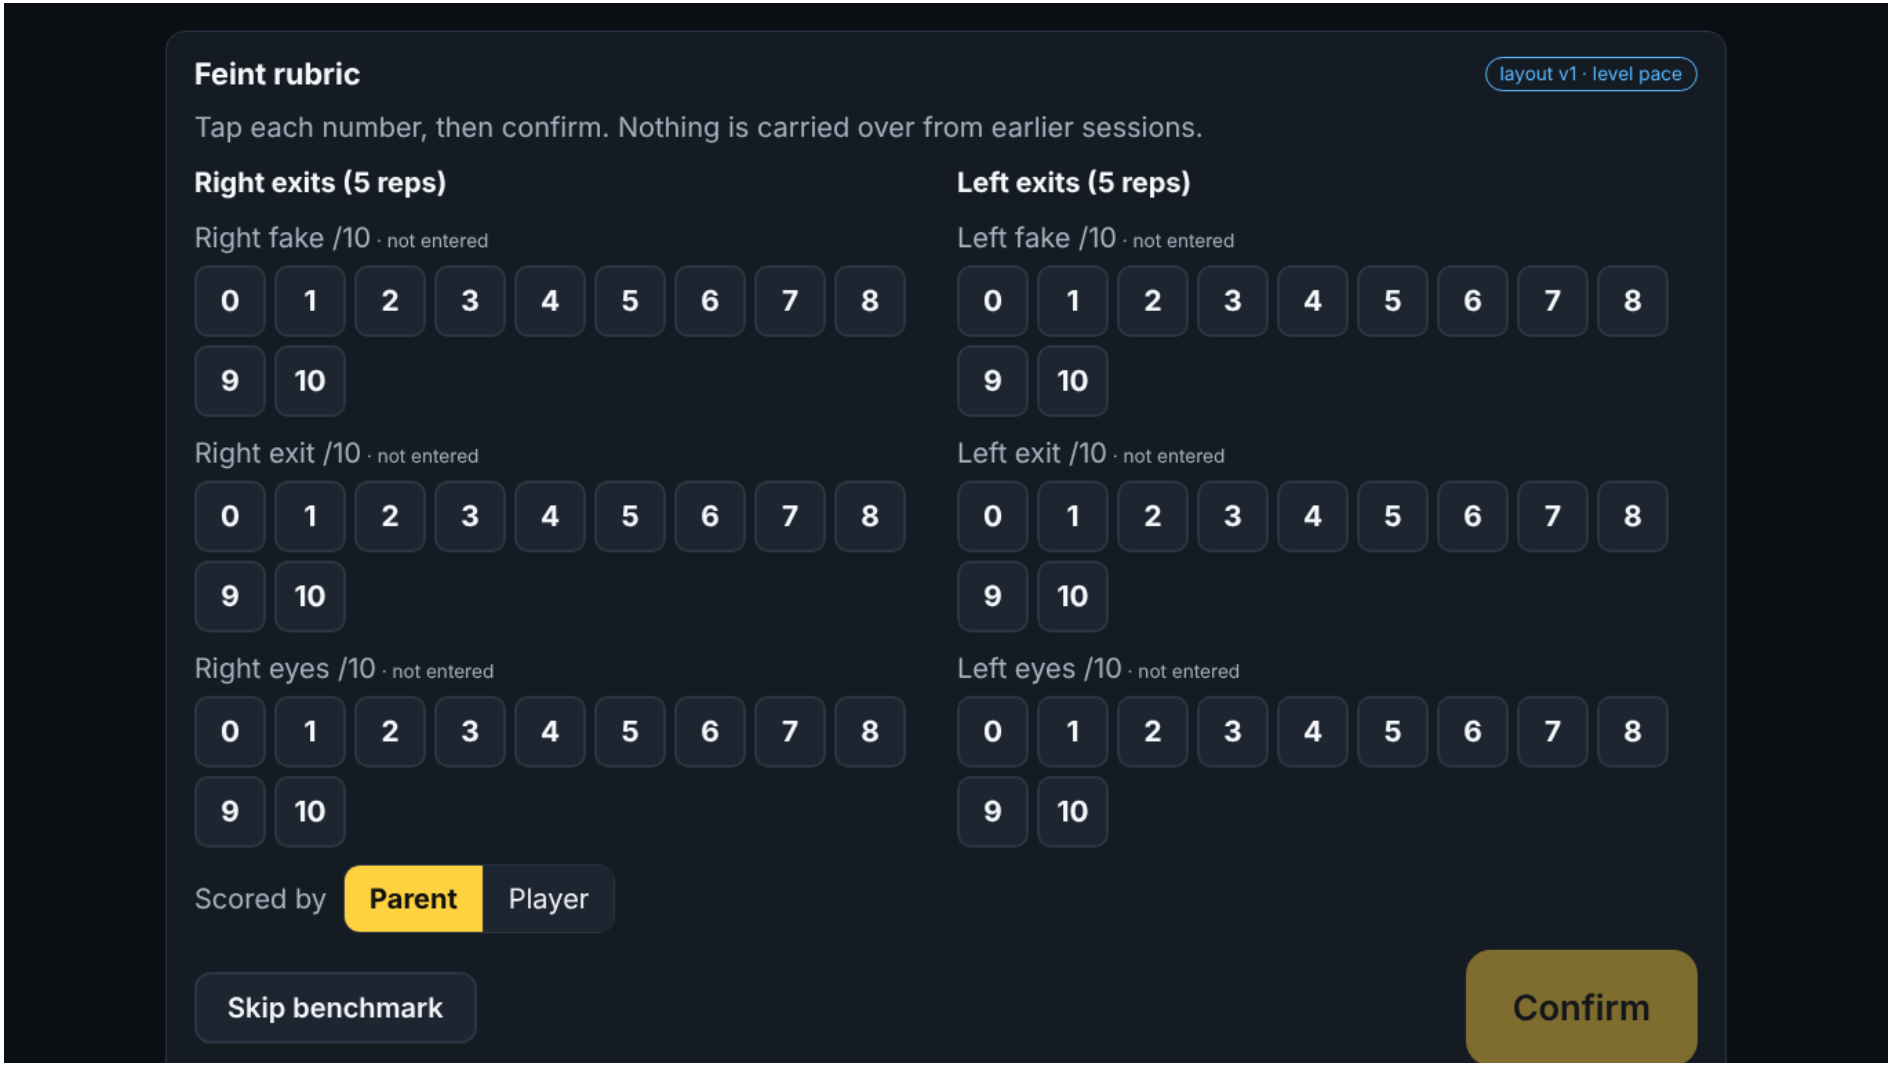

Shown after every drill block: what was done, last time's result for the same drill, Repeat (which runs it again as attempt 2) and Next, which moves on by itself after 20 seconds. An optional note can be added.

A training session

13. Decision D10: the card starts blank, never pre-filled from an earlier session. Each number is one tap (0–10), and Confirm stays disabled until everything is entered. The pill shows the layout version and cue level the result is compared under. The rubric item formerly called 'sell' is now 'fake'.

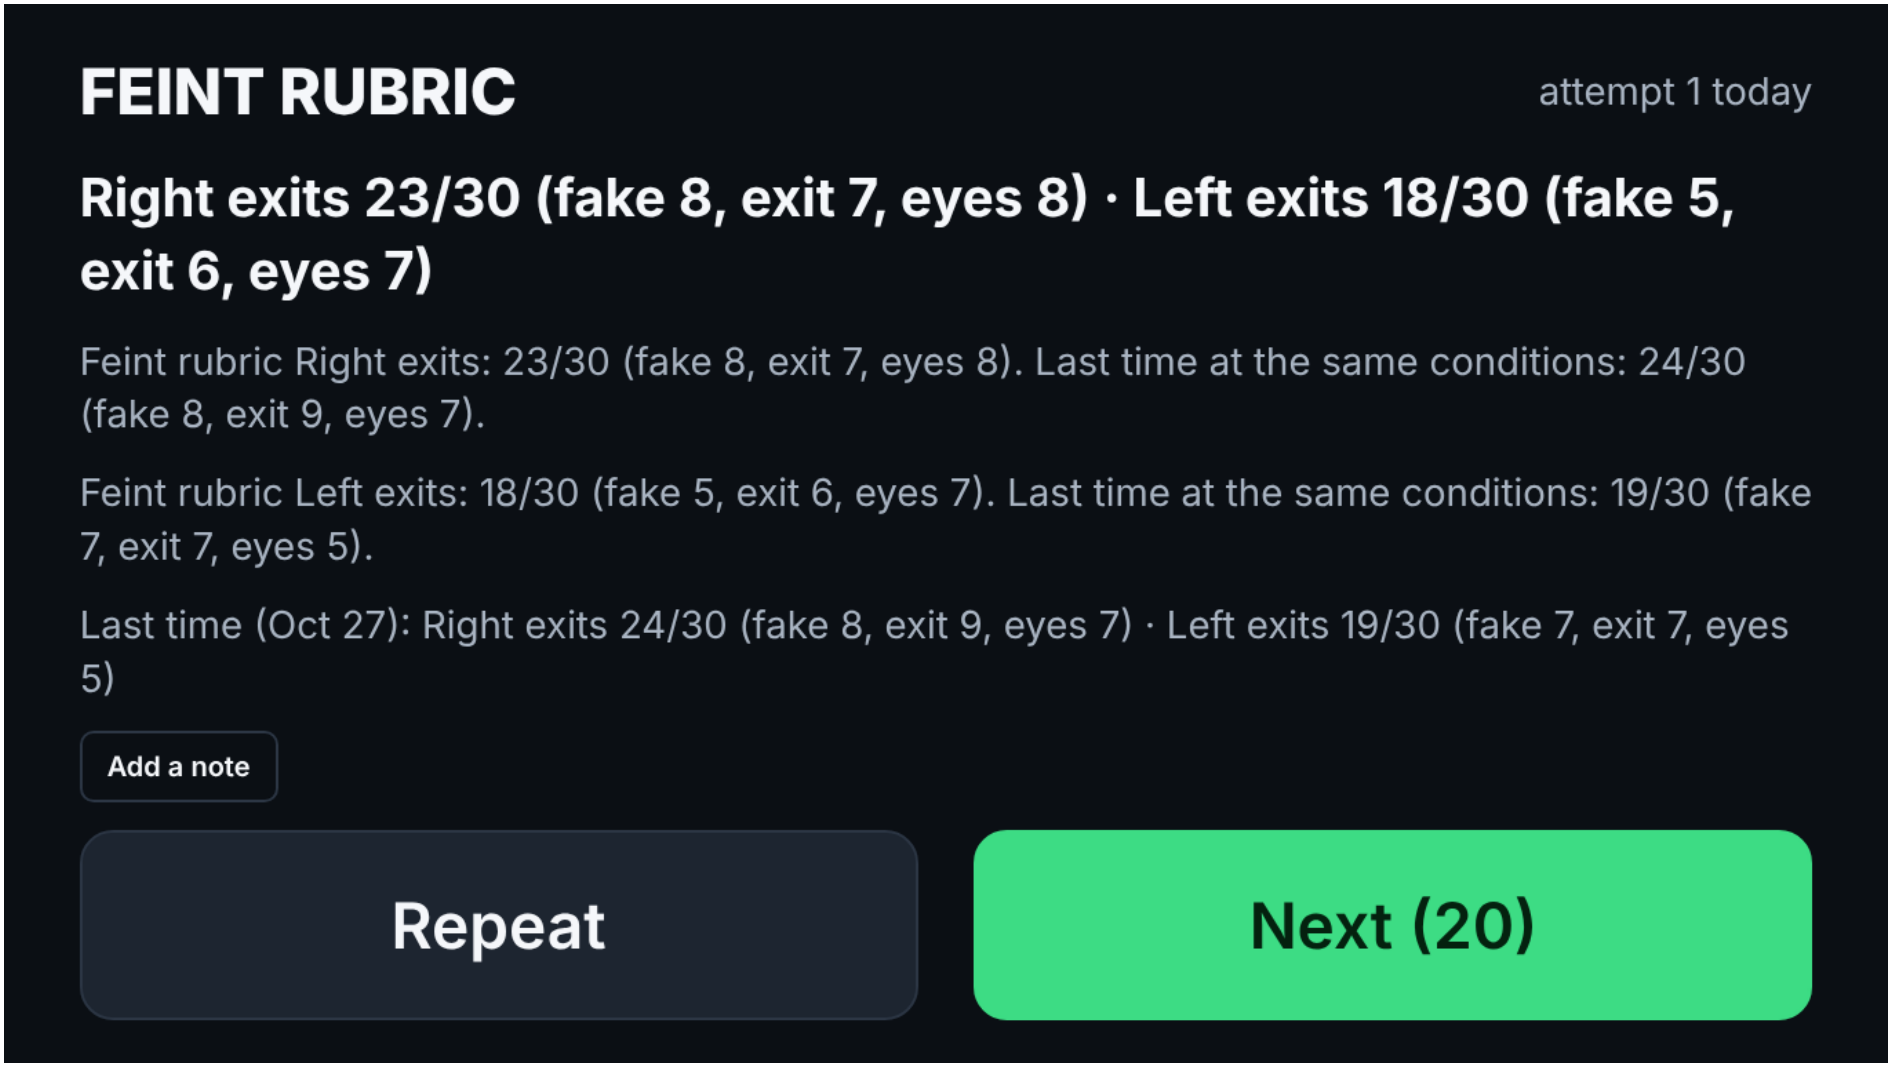

Result card · Feint rubric

A training session

14. End-of-drill card (benchmark)

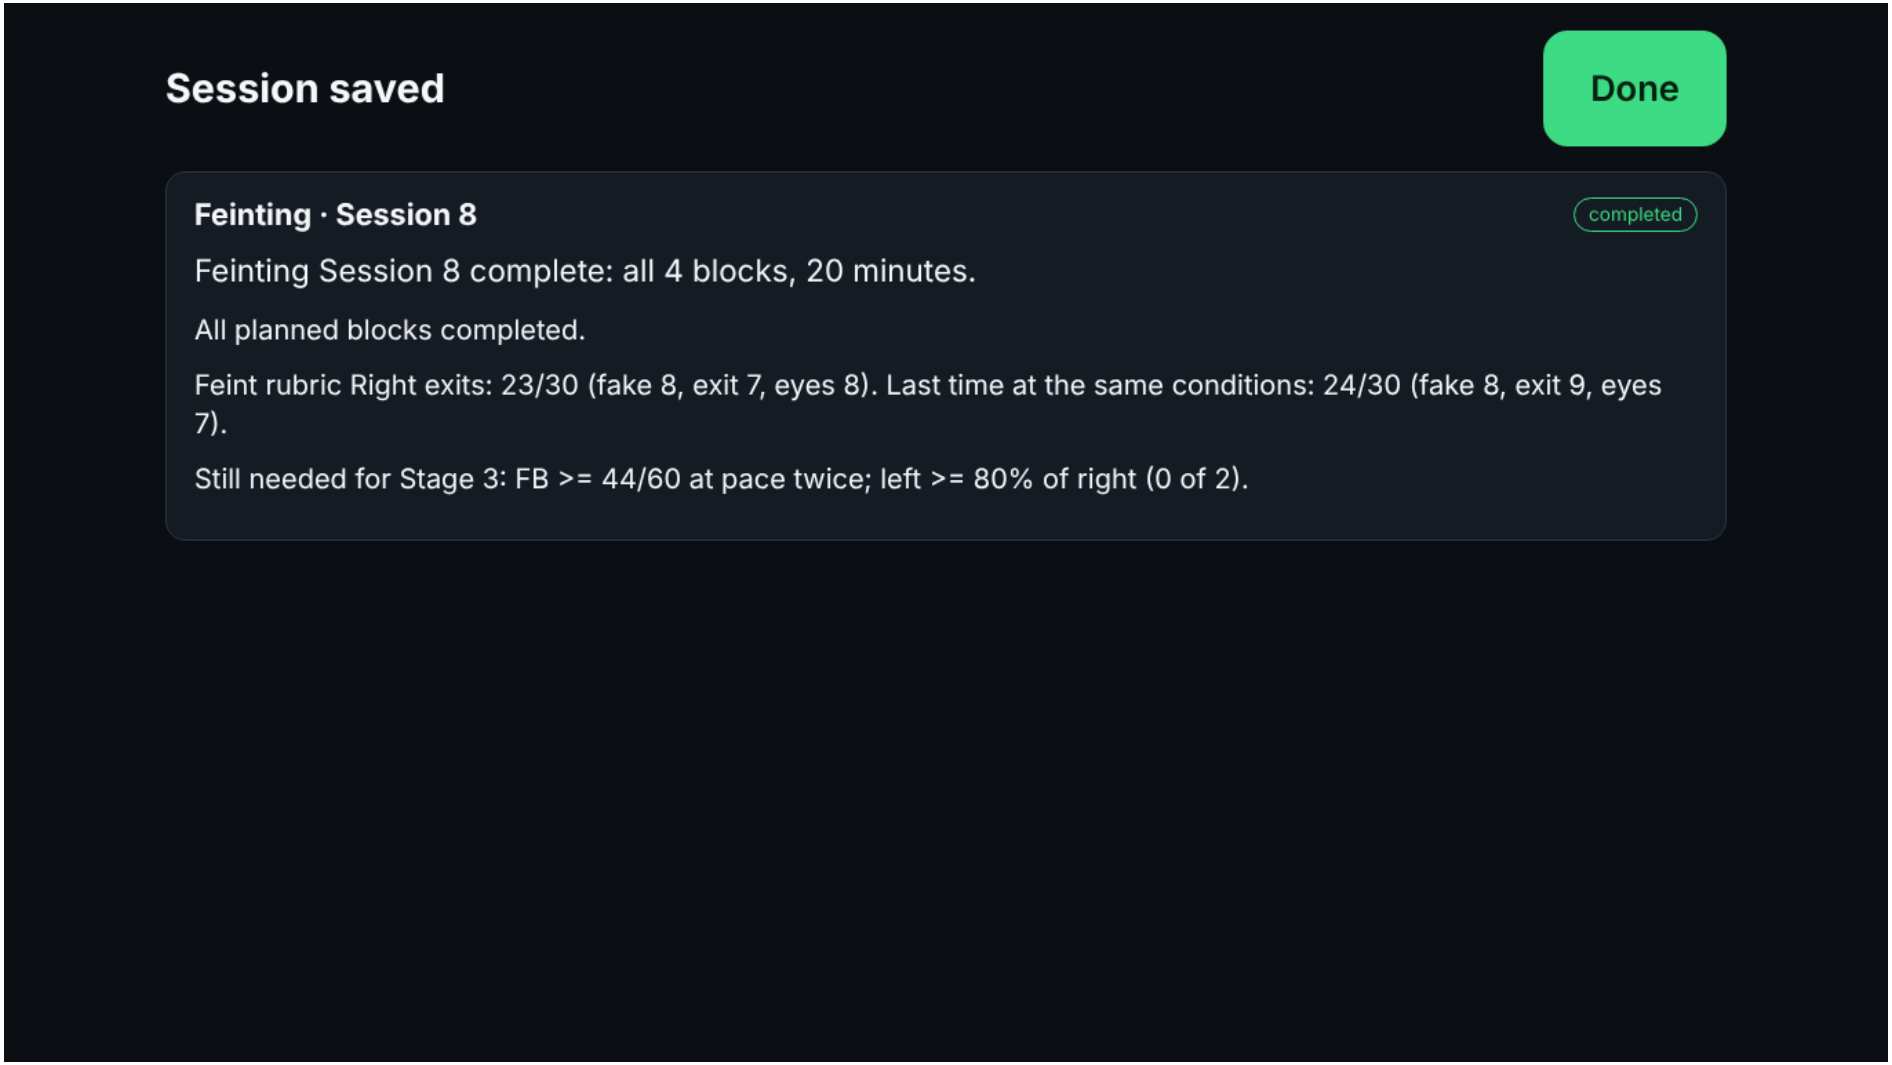

The result is compared only with the last result at the same conditions, in fixed sentences: "up from" only when it really improved, and "Last time at the same conditions" when it did not. No praise words.

A training session

15. Session summary

One completion line, one comparison, one focus (what the stage criteria still need) and, when earned, the unlock. A session counts only when the warm-up and every work block ran fully and the pause limits were kept.

Progress reporting — Fictional sample history for a player called "Sam".

16. Progress · Week

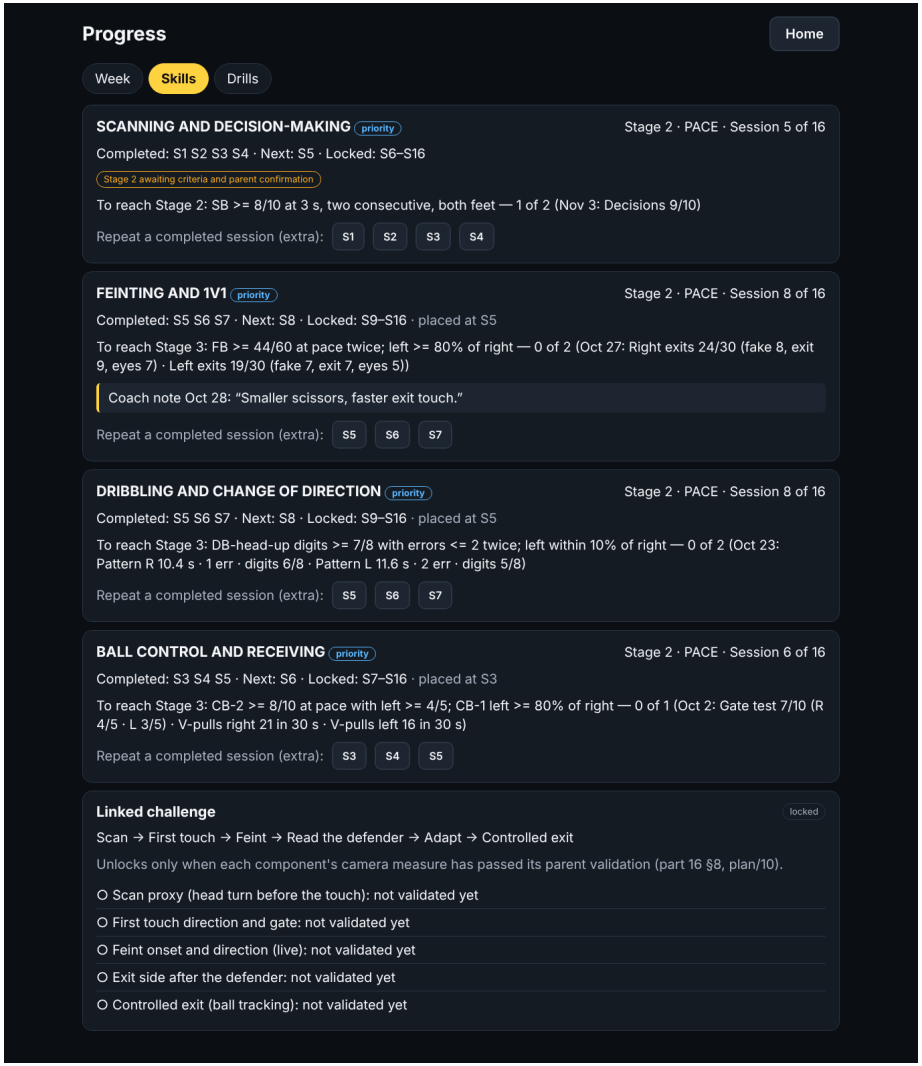

Planned, completed and minutes for the week, each area's sessions with their status, sessions not counted (partial or stopped) listed apart, and the last 8 weeks of completed sessions. An empty week shows a single neutral line.

Progress reporting

17. Progress · Skills

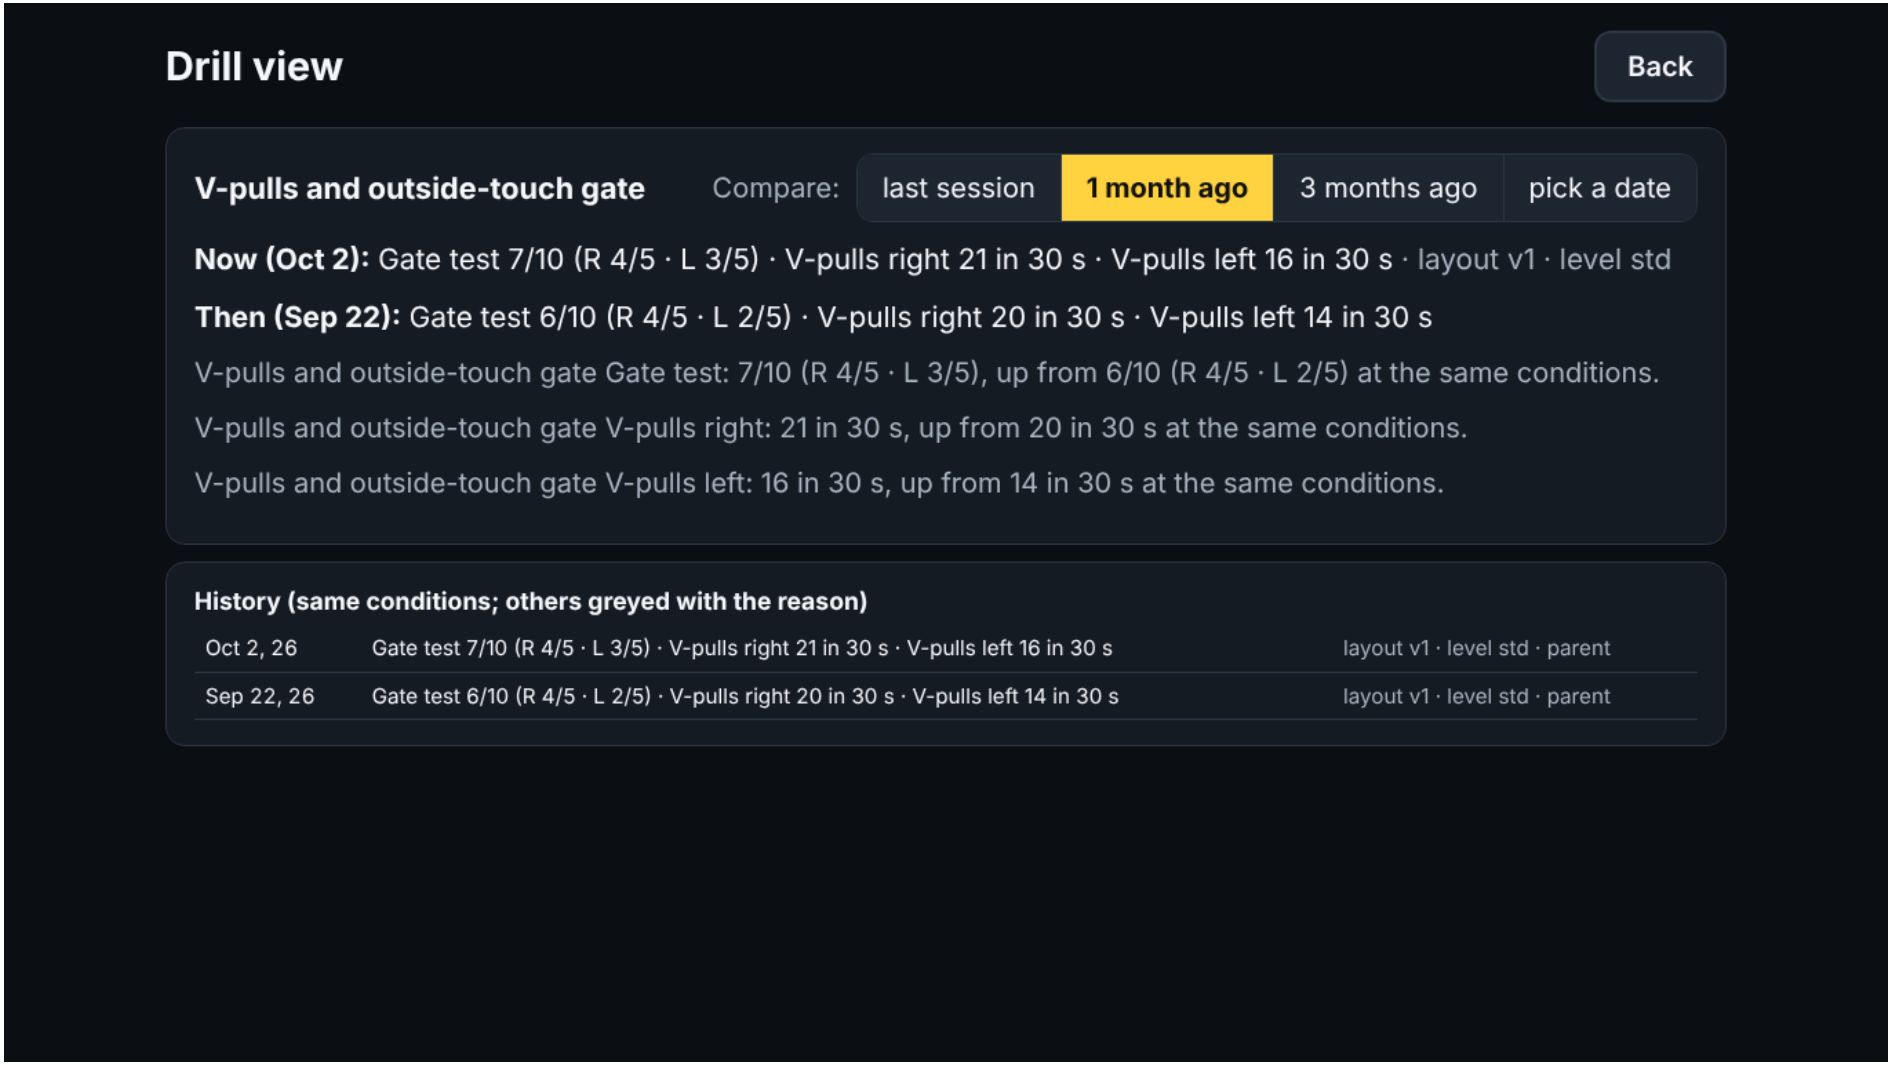

Per area: the stage (CONTROL, PACE, REACT, TRANSFER) and session, completed and locked sessions, what the next stage needs (qualifying tests on different days, parent- or app-scored), the latest result, the coach's note and repeats. At the bottom, the linked challenge stays locked until each camera measure has passed the parent's validation.

Progress reporting

18. Drill view · comparison picker

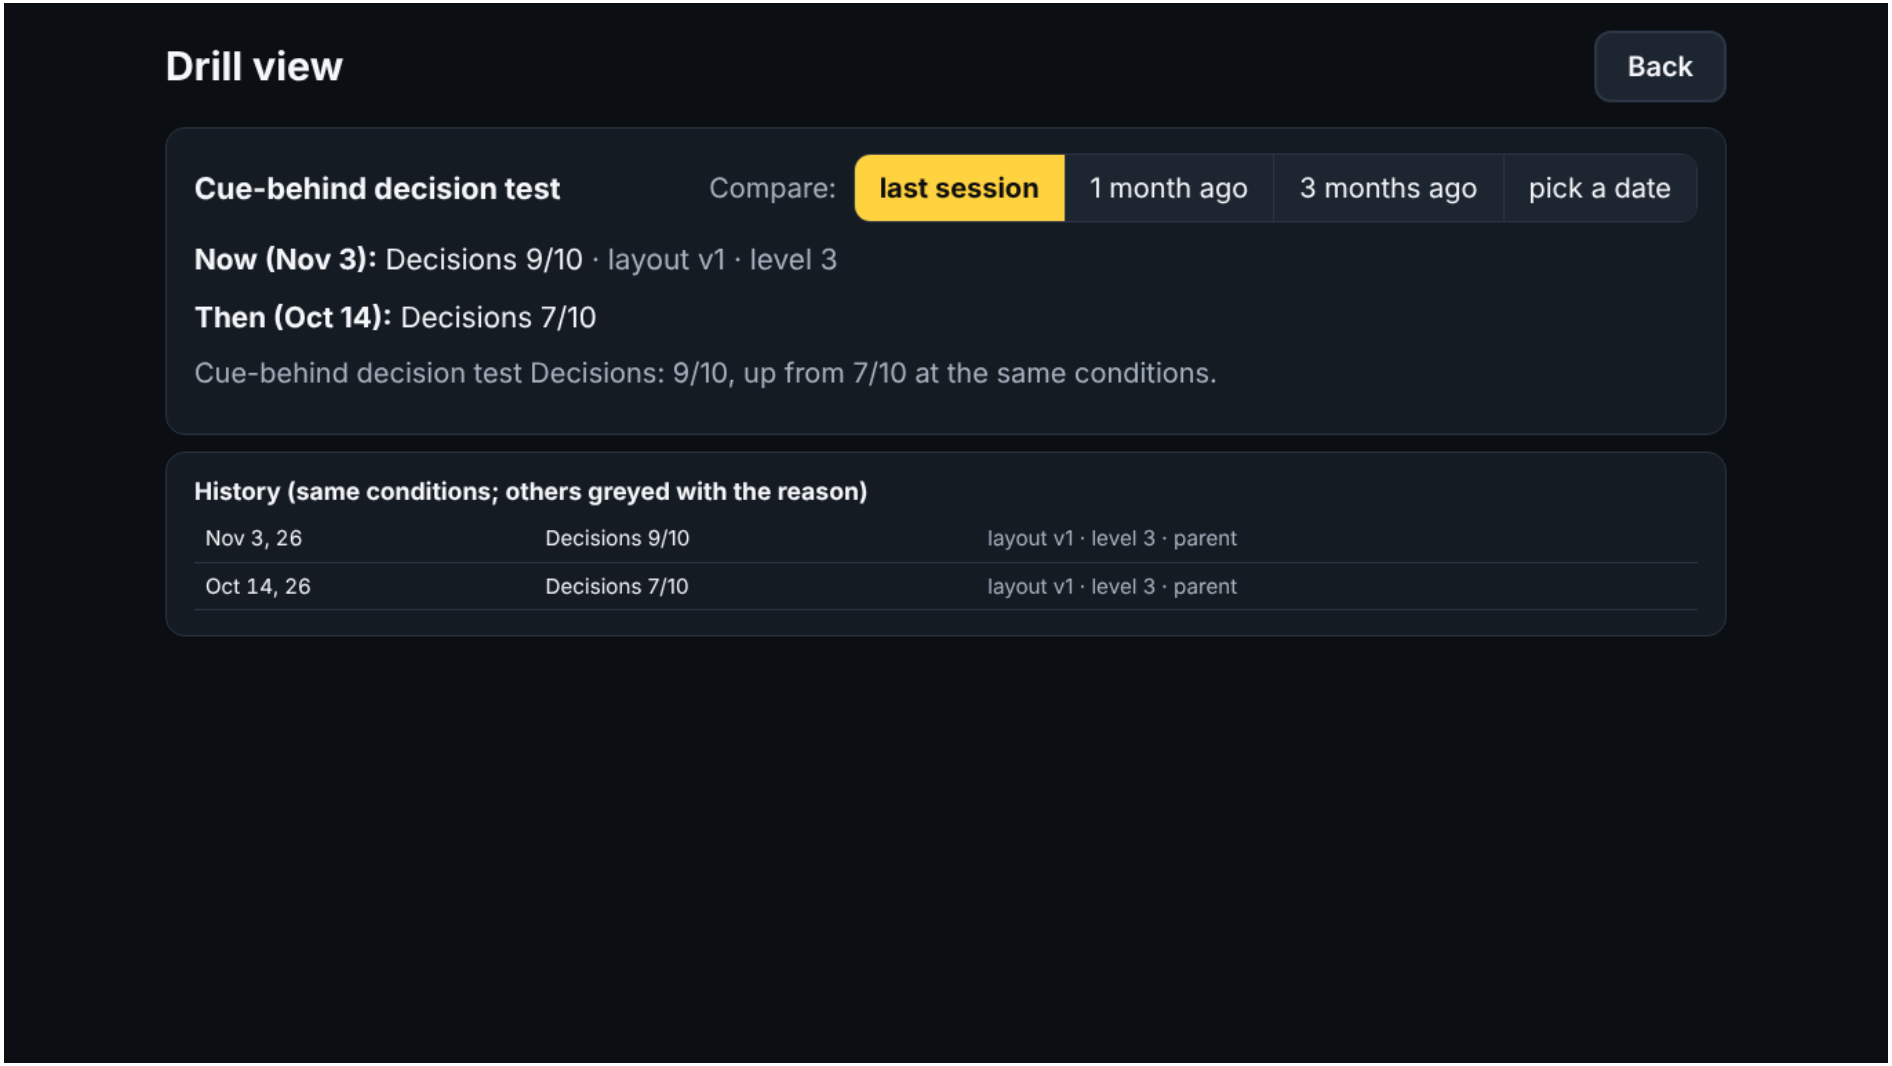

Any benchmark compared with last session, 1 month ago, 3 months ago or a chosen date, at the same conditions only. The history lists every result; results at other conditions are greyed with the reason.

Progress reporting

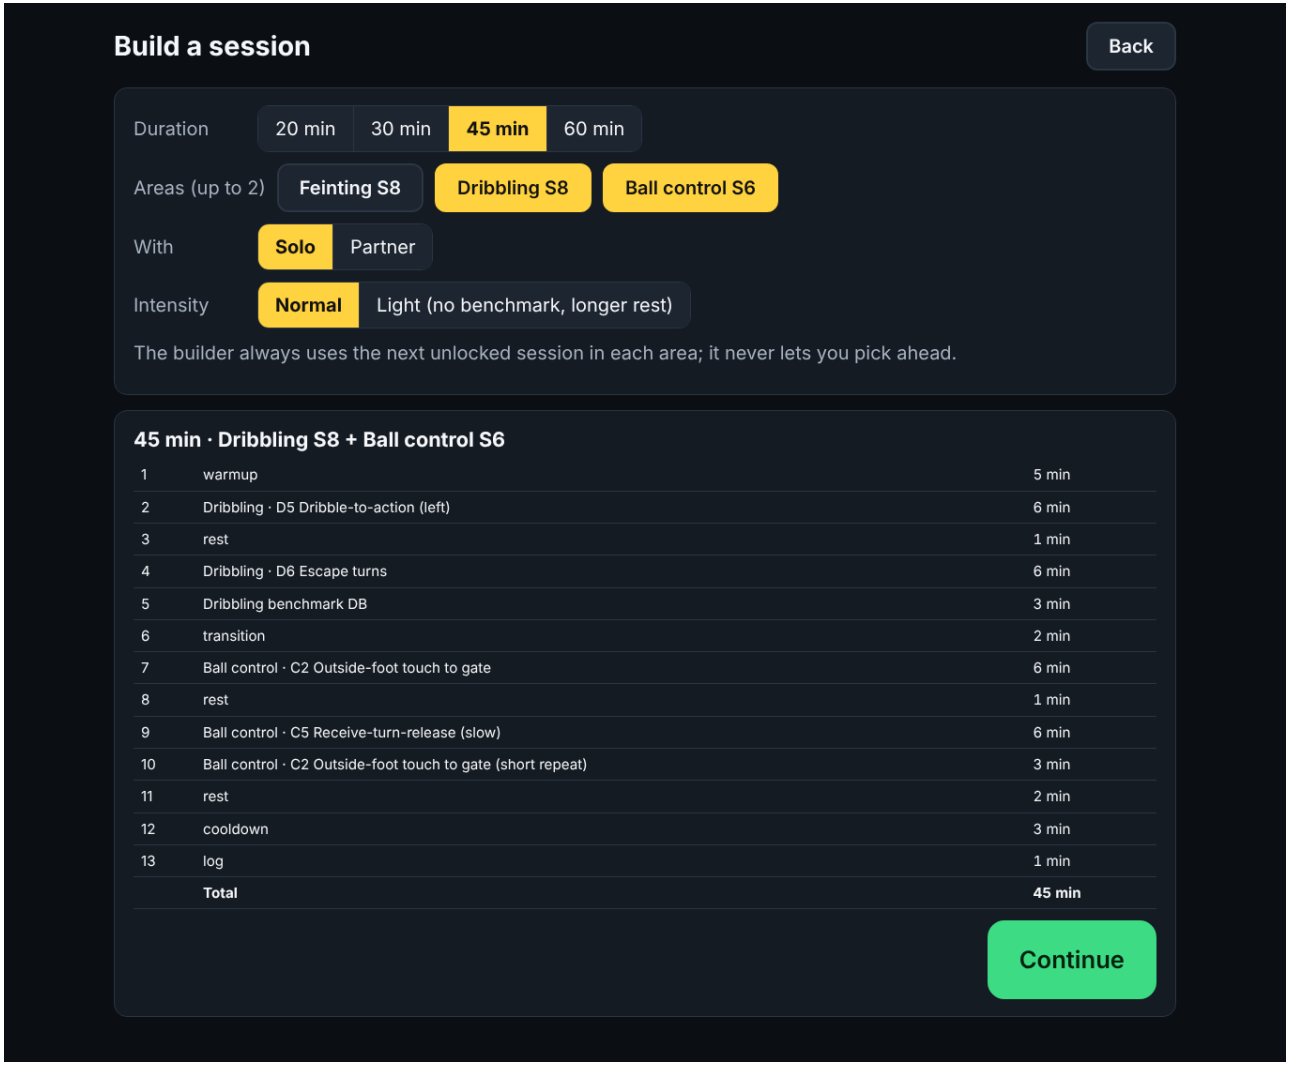

19. Drill view · improvement

A genuine improvement at the same conditions, stated factually.

20. Session builder

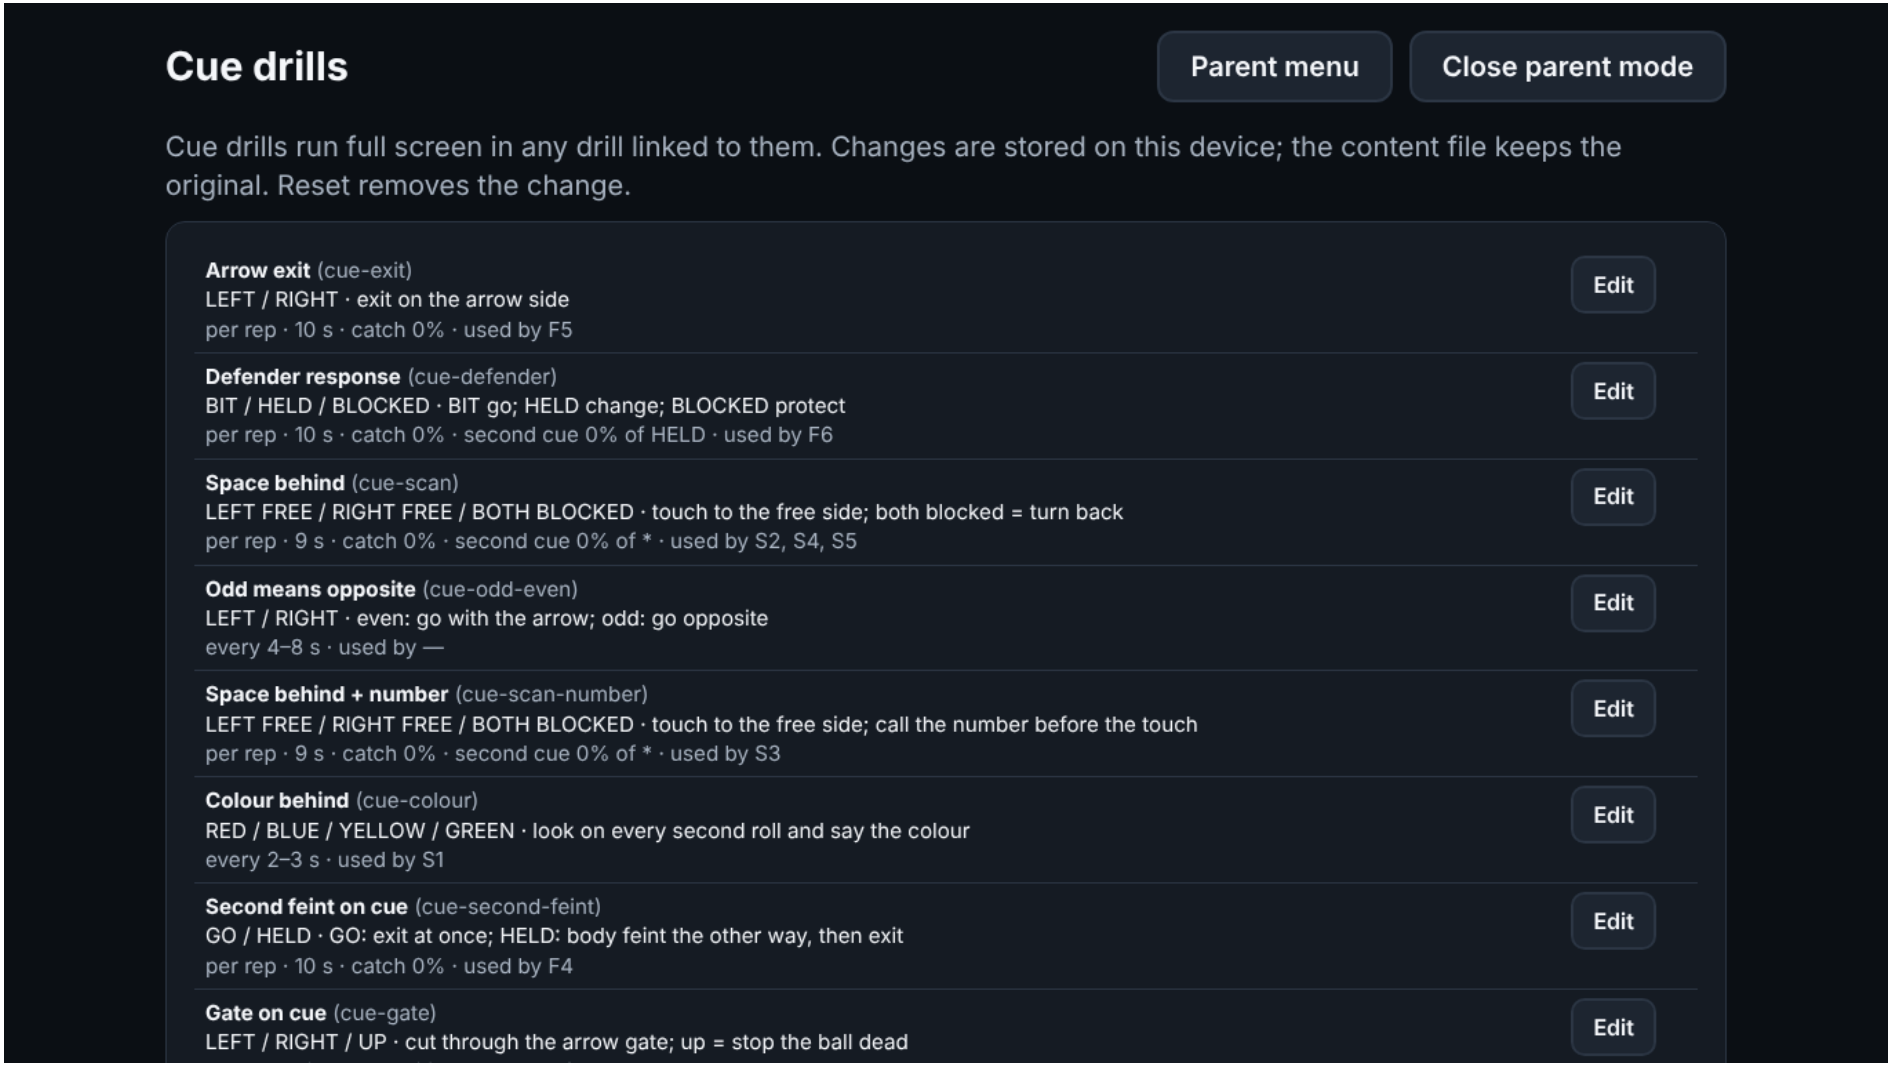

Builds a 30, 45 or 60-minute session from the next unlocked session in each chosen area: duration, areas, solo or partner, normal or light. The block list must add up to the chosen time.

Cue drills — Full-screen word and arrow cues with a tone. Since the plan update the 3D defender is the default for scored reactive drills; these cues remain for instruction blocks, the fixed anchor A3 and the fallback when 3D is off or WebGL is missing (shown here).

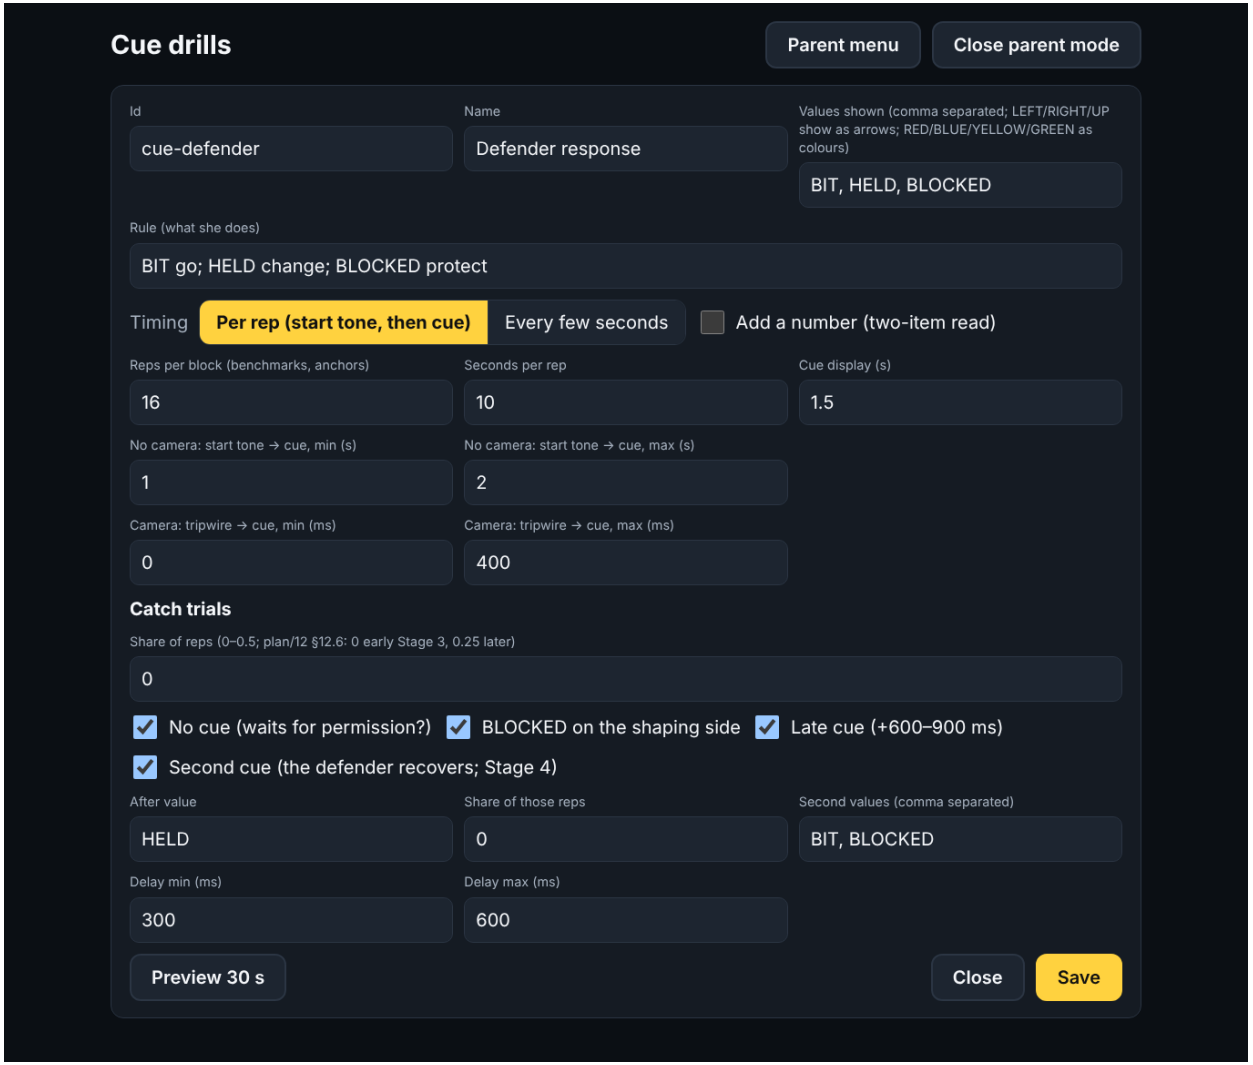

21. Coach · Cue drills

Every cue drill with its values, timing, catch-trial share and which drills use it. Changes are stored on the device; the content file keeps the original, and Reset restores it.

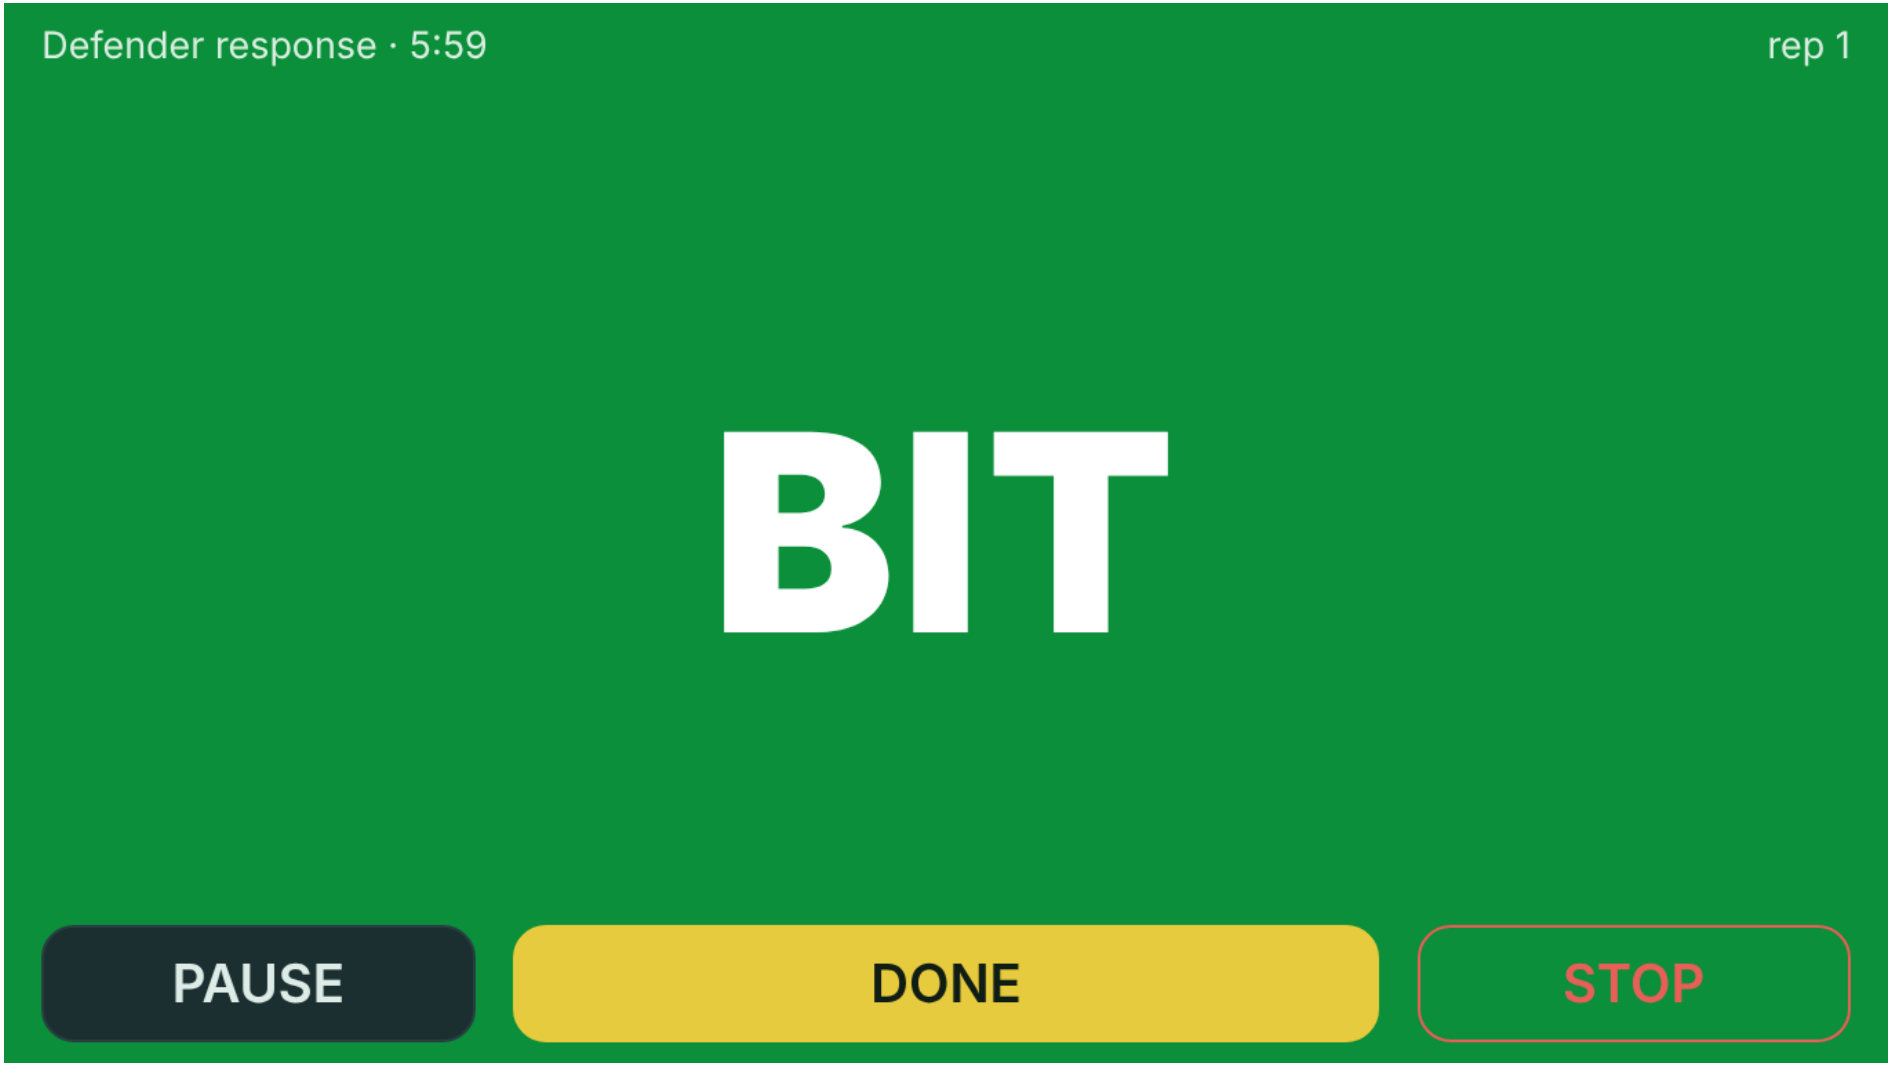

22. Coach · Cue drill editor

Edit the values shown, per-rep or interval timing, start-to-cue and tripwire delays, catch trials (no cue, blocked on the shaping side, late cue) and the second cue (the defender recovers). Preview runs it full screen for 30 seconds.

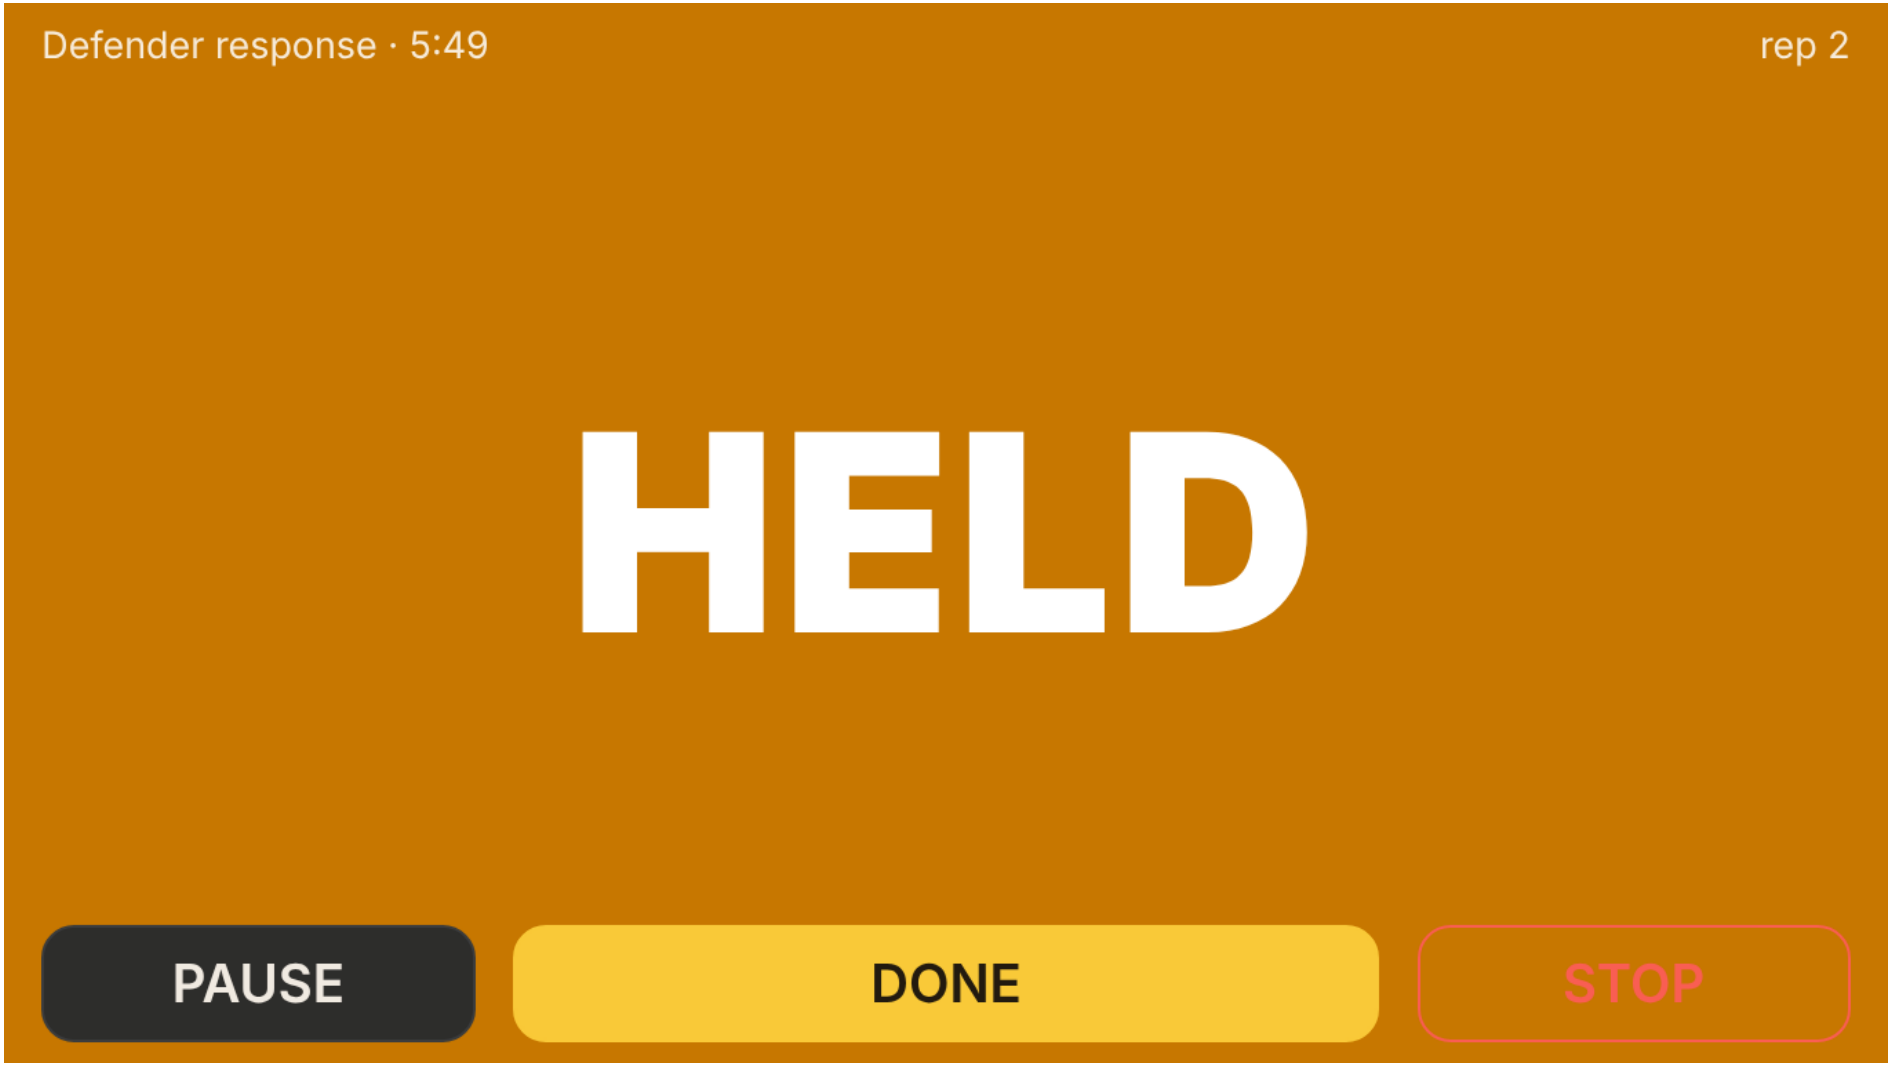

23. Cue · BIT

Defender response drill: BIT means the defender bit on the feint, so go.

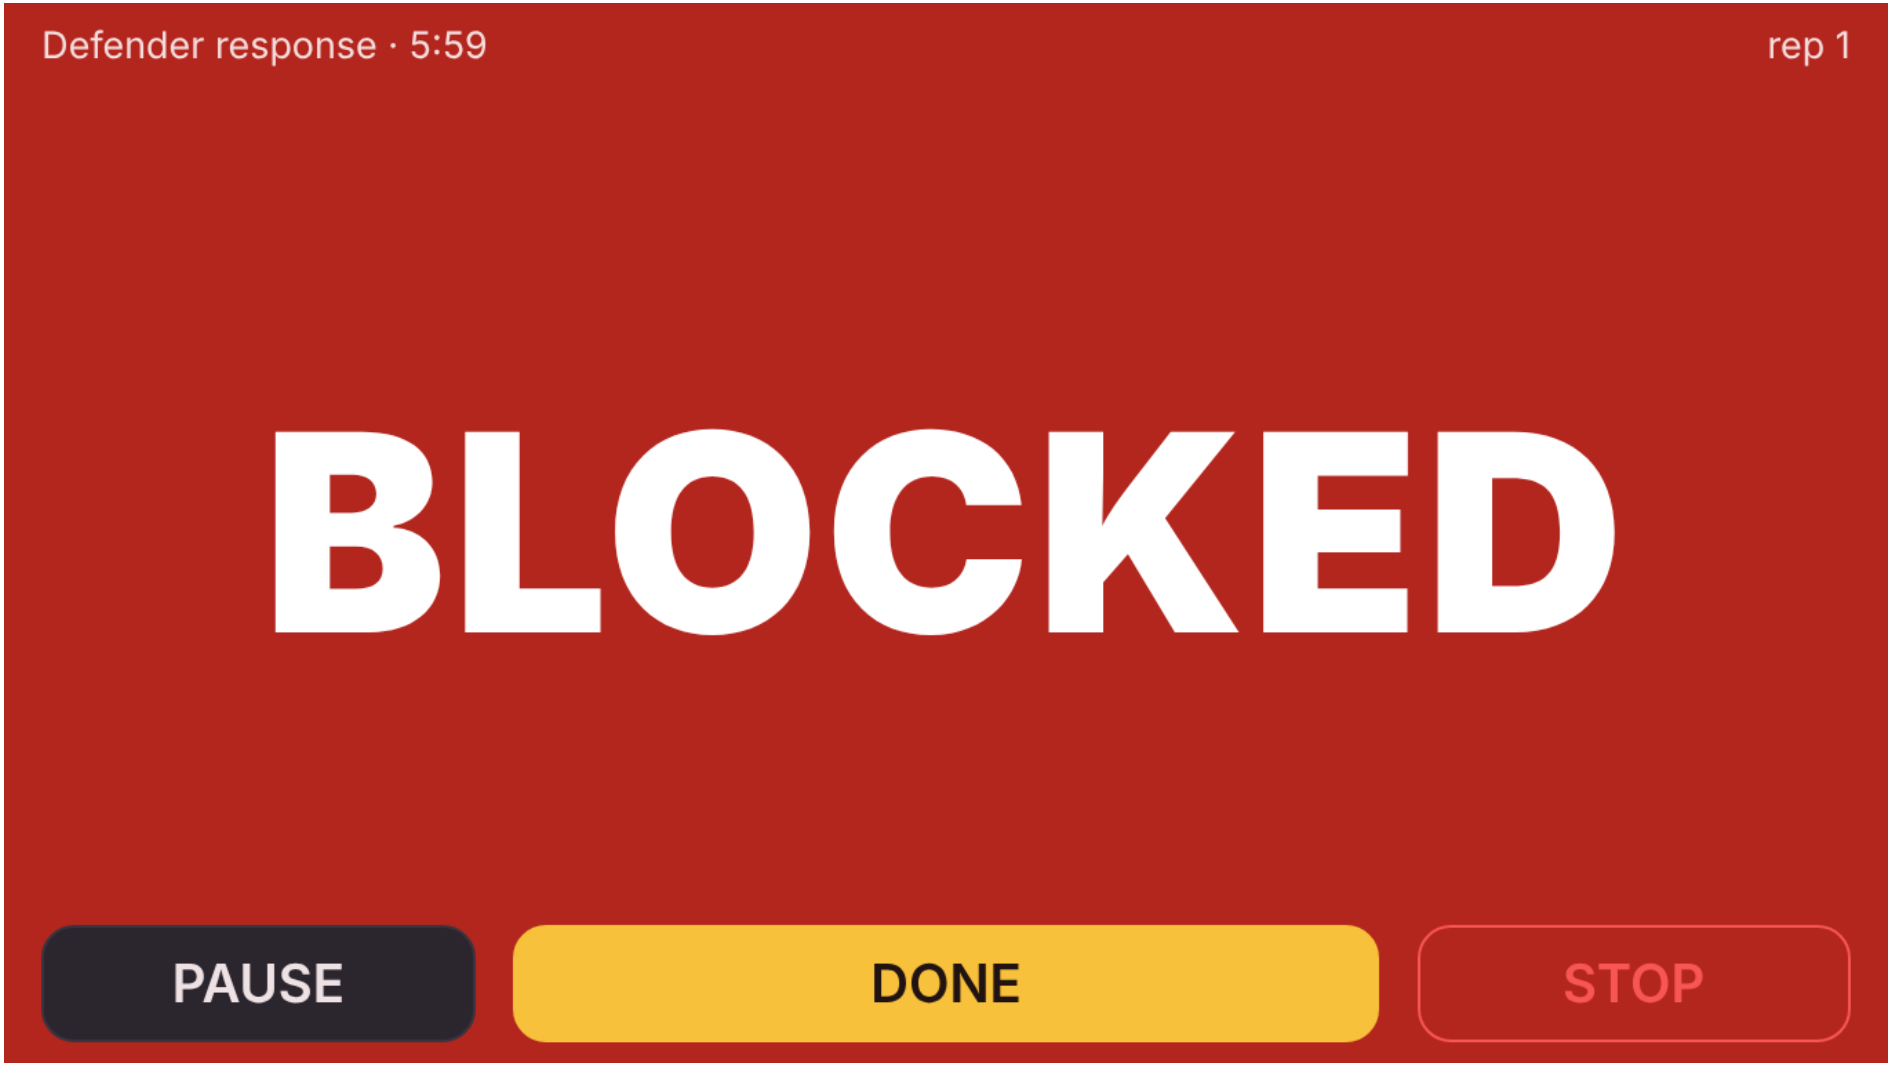

24. Cue · HELD

HELD: the defender held, so change (a push-and-go or a second feint).

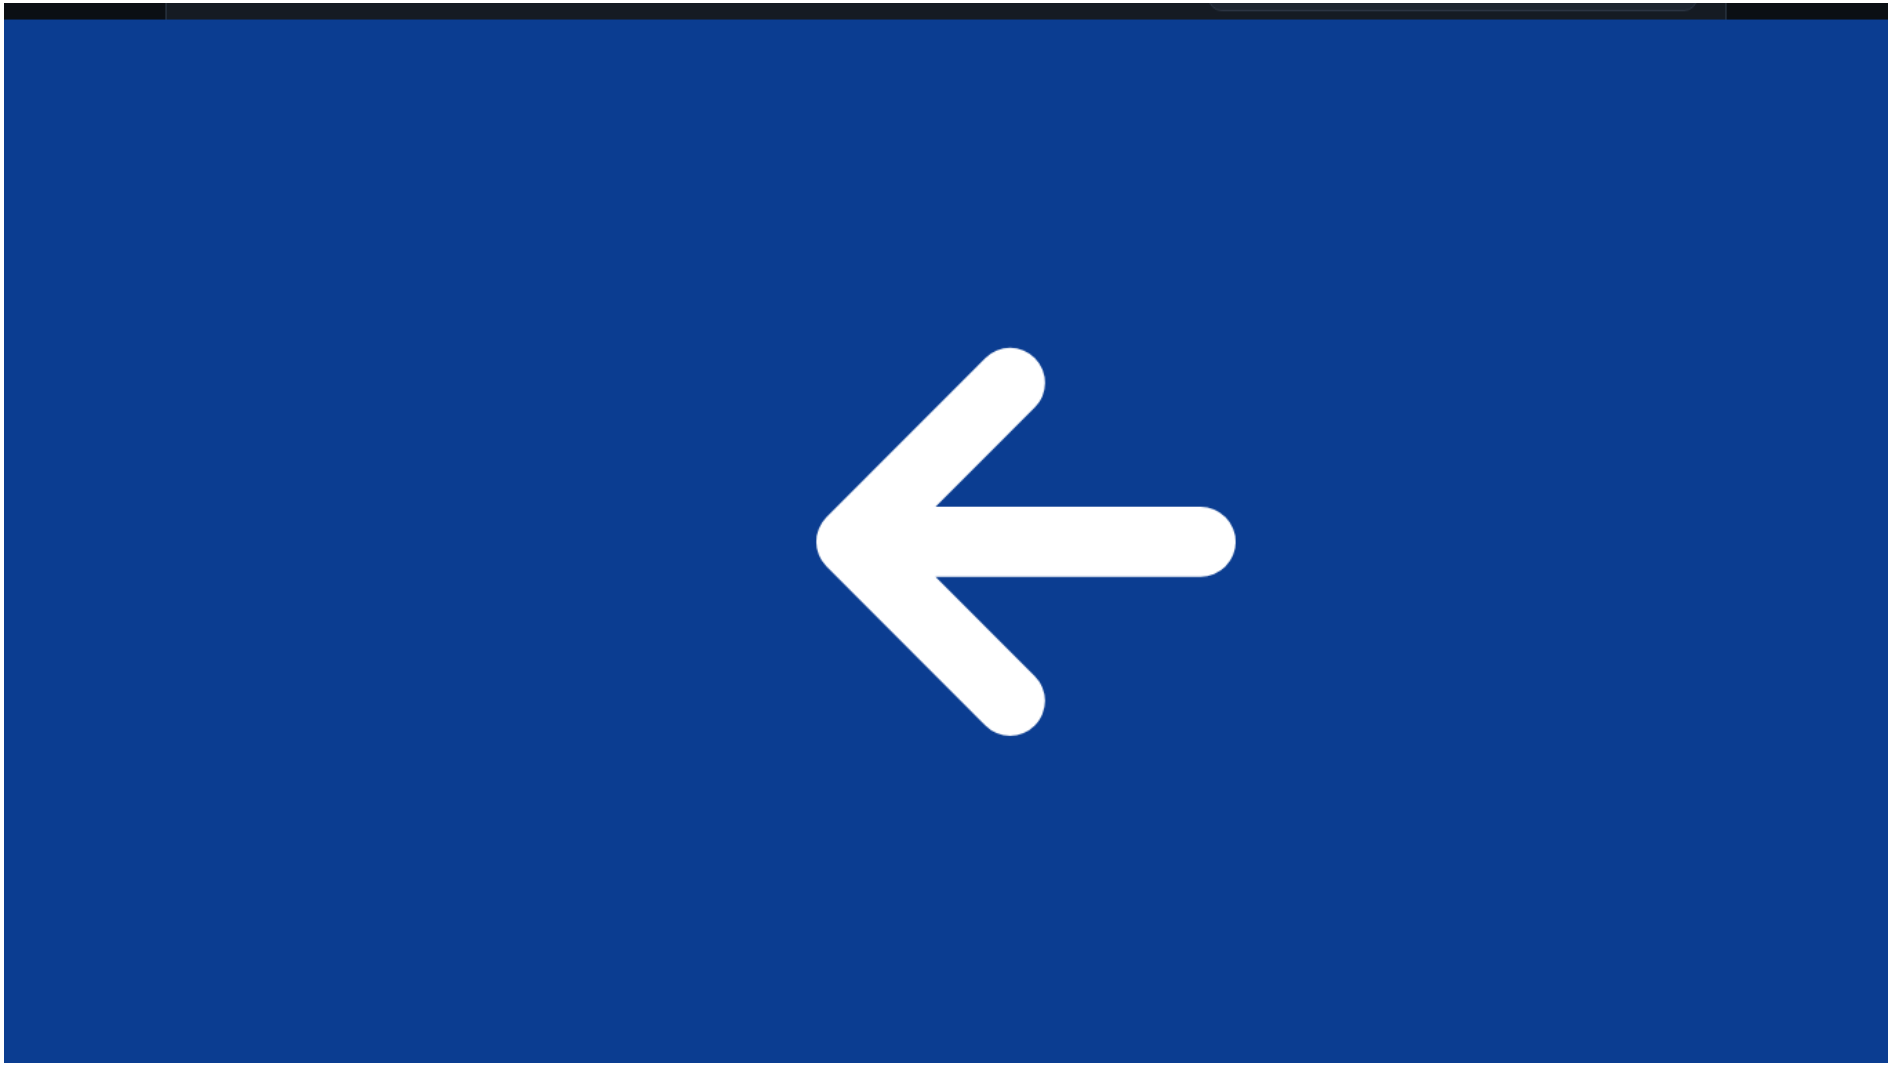

25. Cue · BLOCKED

BLOCKED: protect the ball and release (shield turn or pass back).

26. Cue · arrow

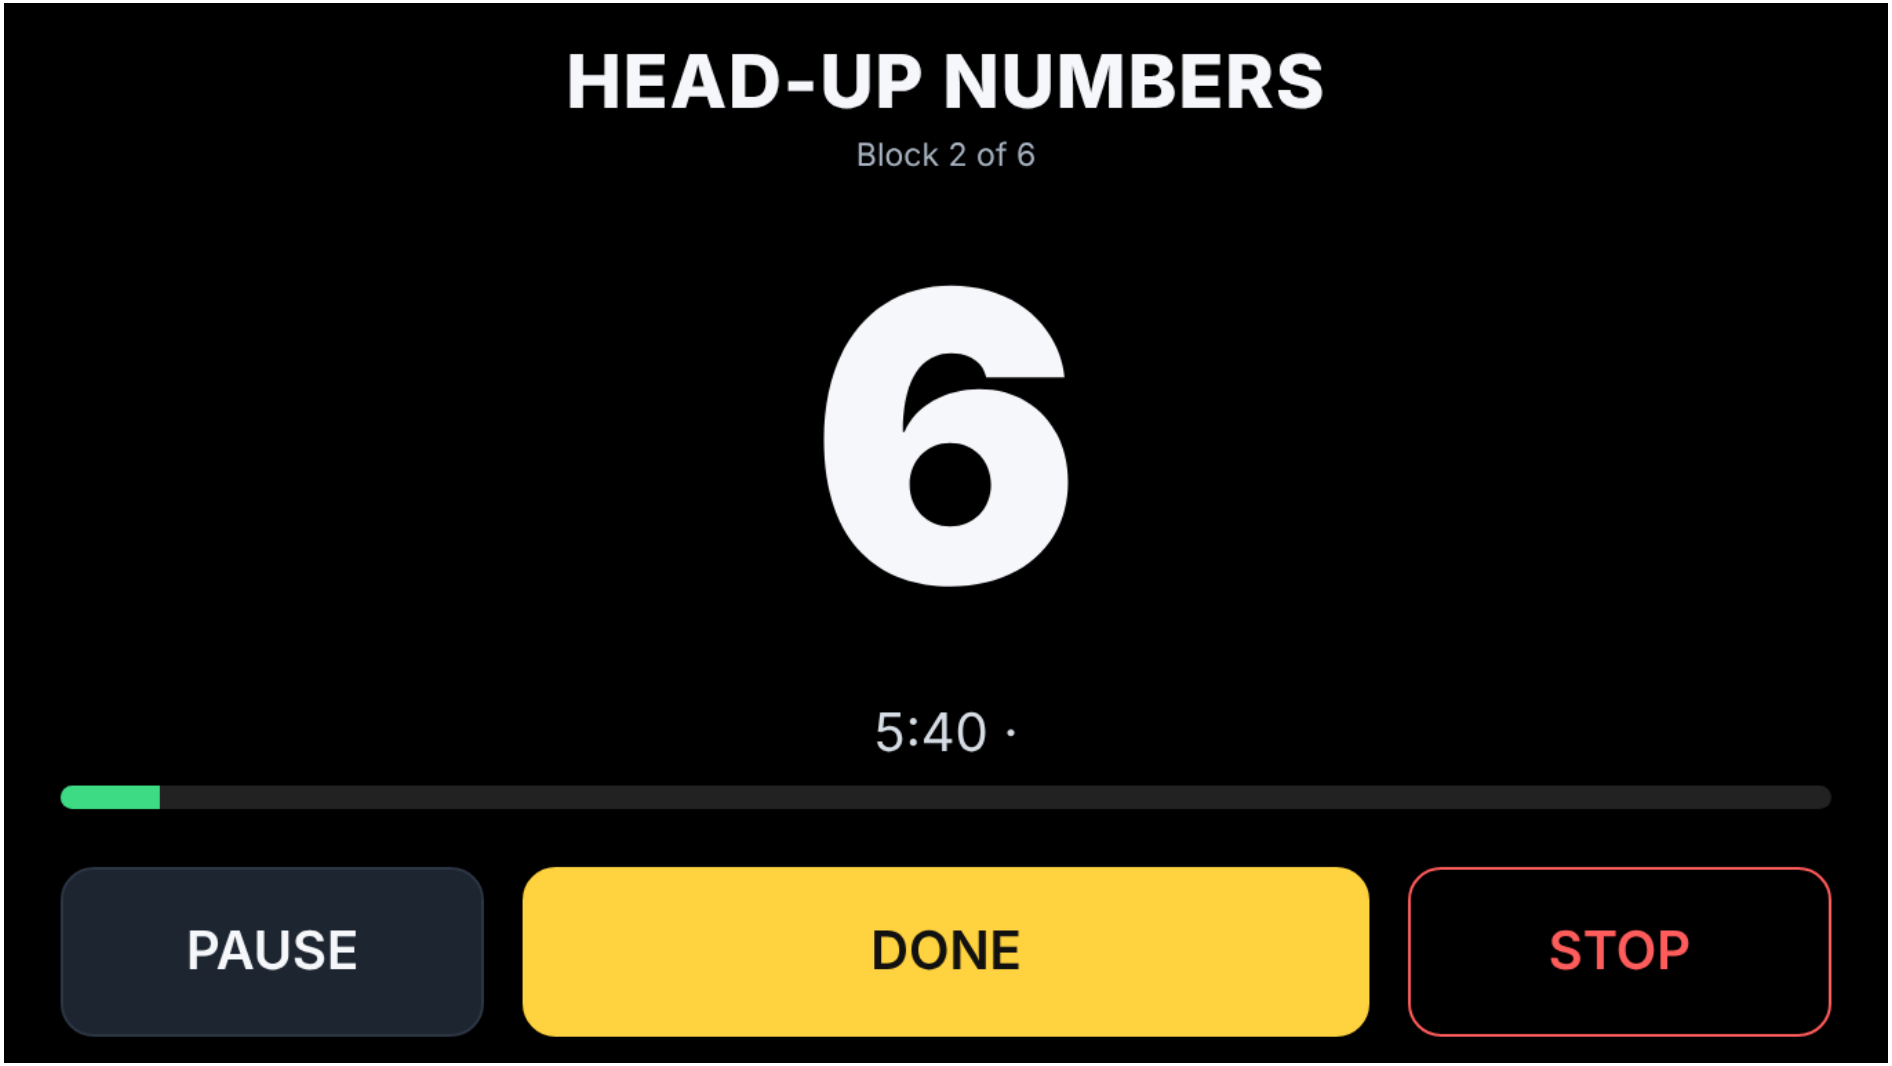

Arrow-exit drill: feint away and exit on the arrow side. Arrows fill at least a third of the screen height.

Cue drills

27. Head-up numbers

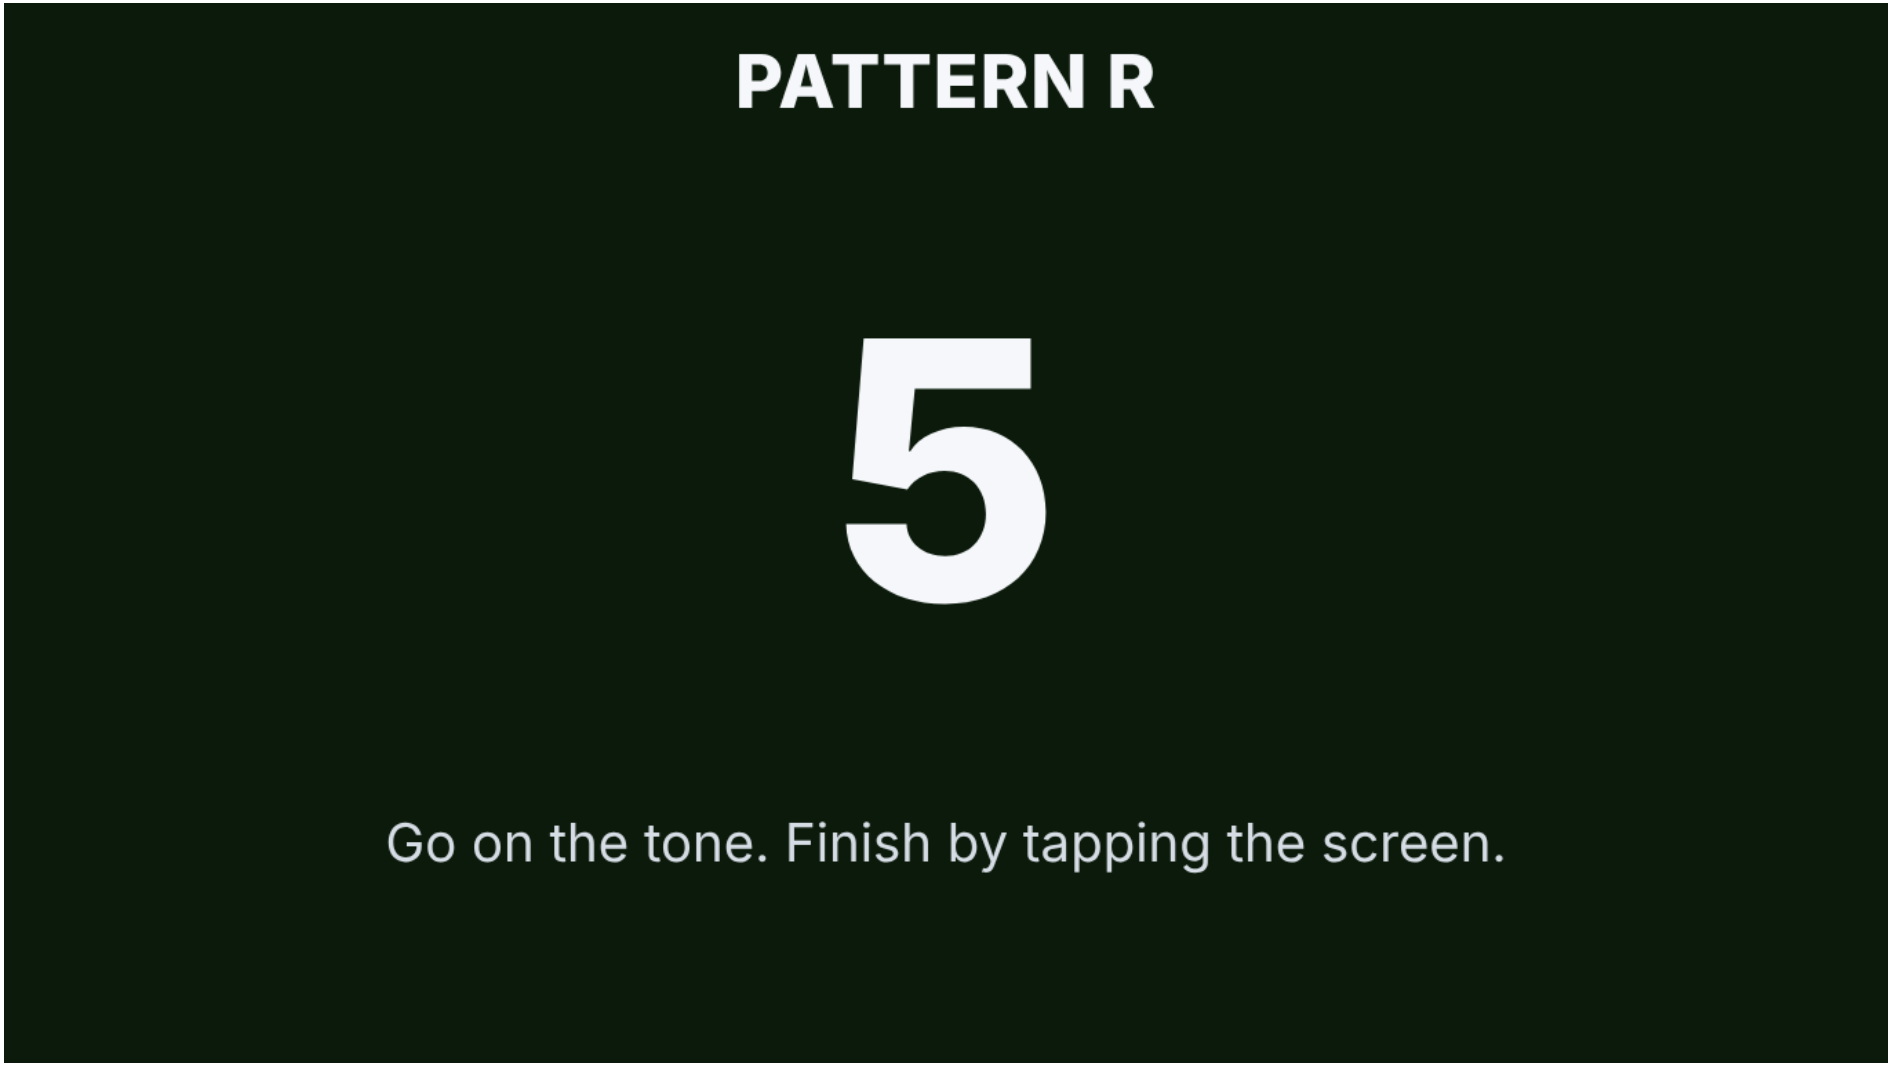

For head-up dribbling: a large digit changes every 1.5 seconds and the player calls it out while dribbling.

Cue drills

28. Slalom benchmark · ready

The app times the slalom itself: a countdown, then a start tone.

Cue drills

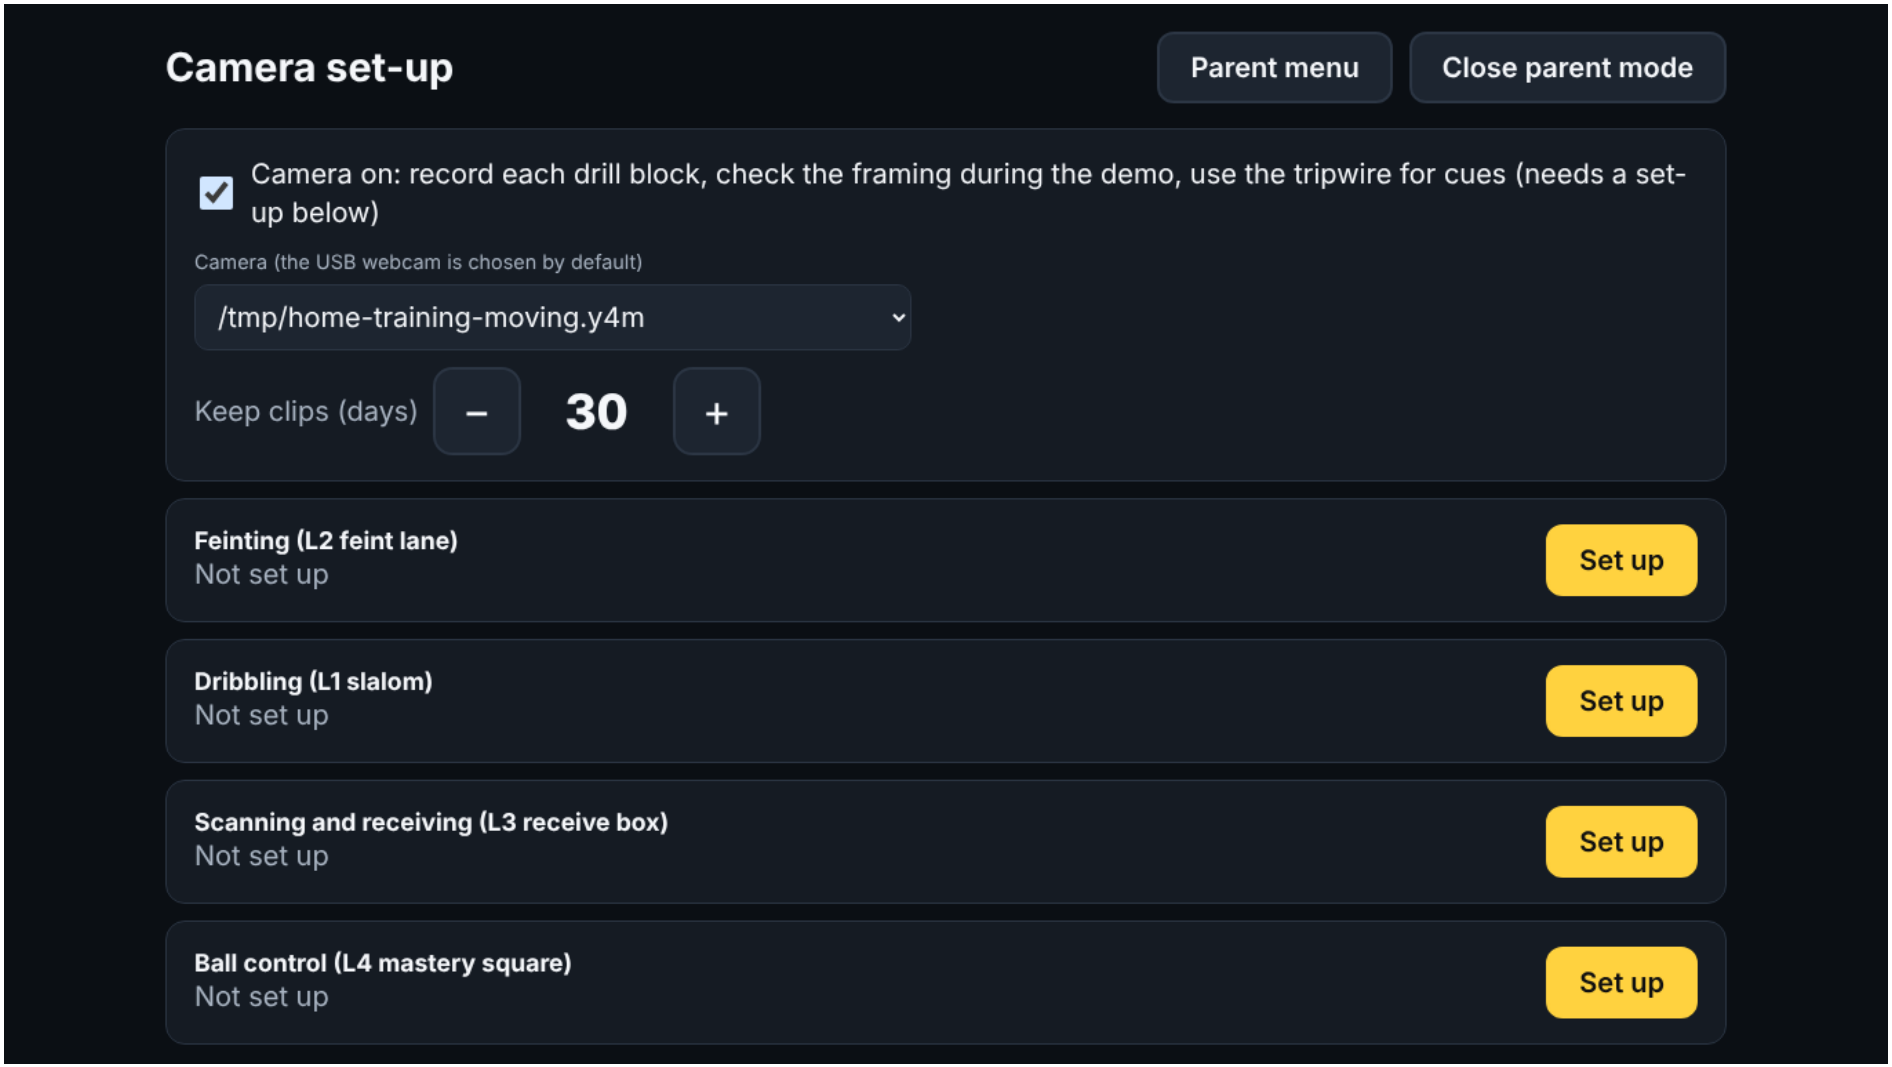

29. Slalom benchmark · finish target

The whole screen is the finish target: one tap anywhere stops the clock. Both patterns are timed and the times pre-fill the result form.

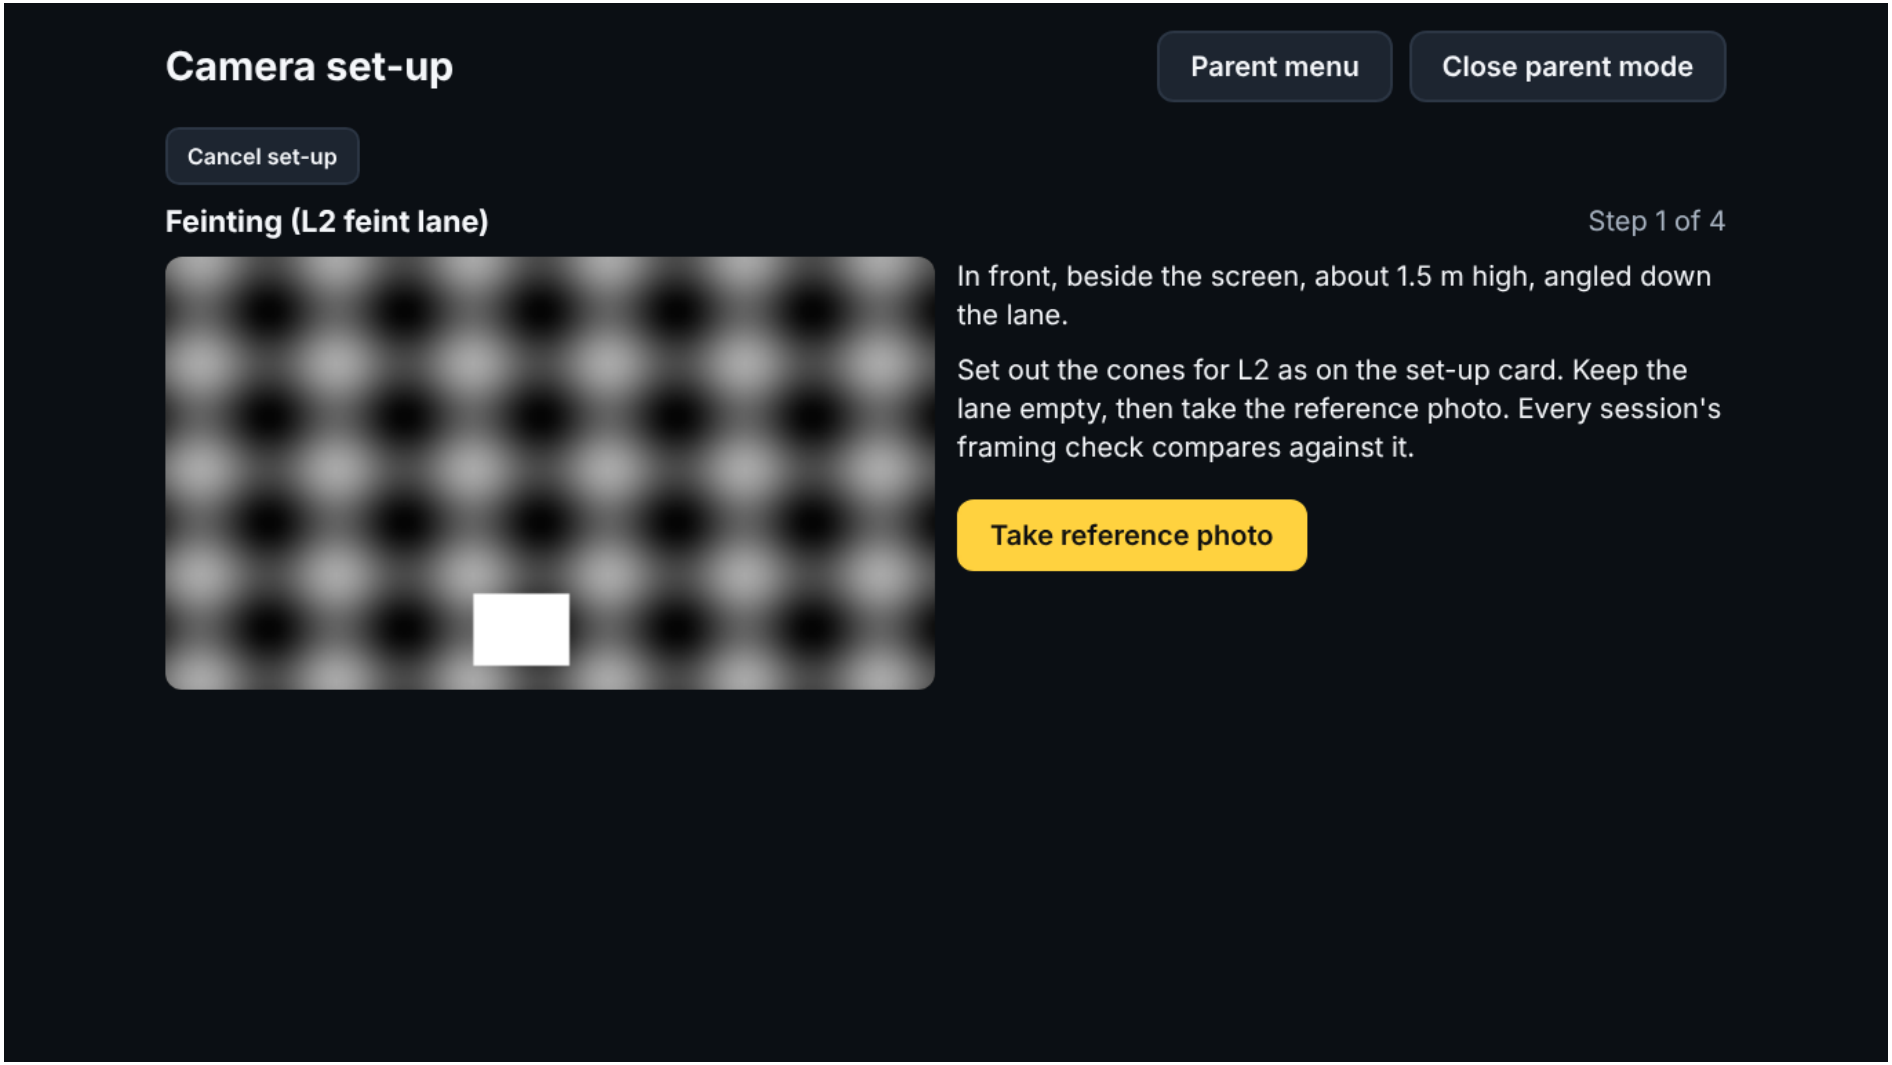

30. Camera set-up

Turns the camera on, picks the USB webcam by default, sets how long clips are kept, and shows the set-up status for each drill family.

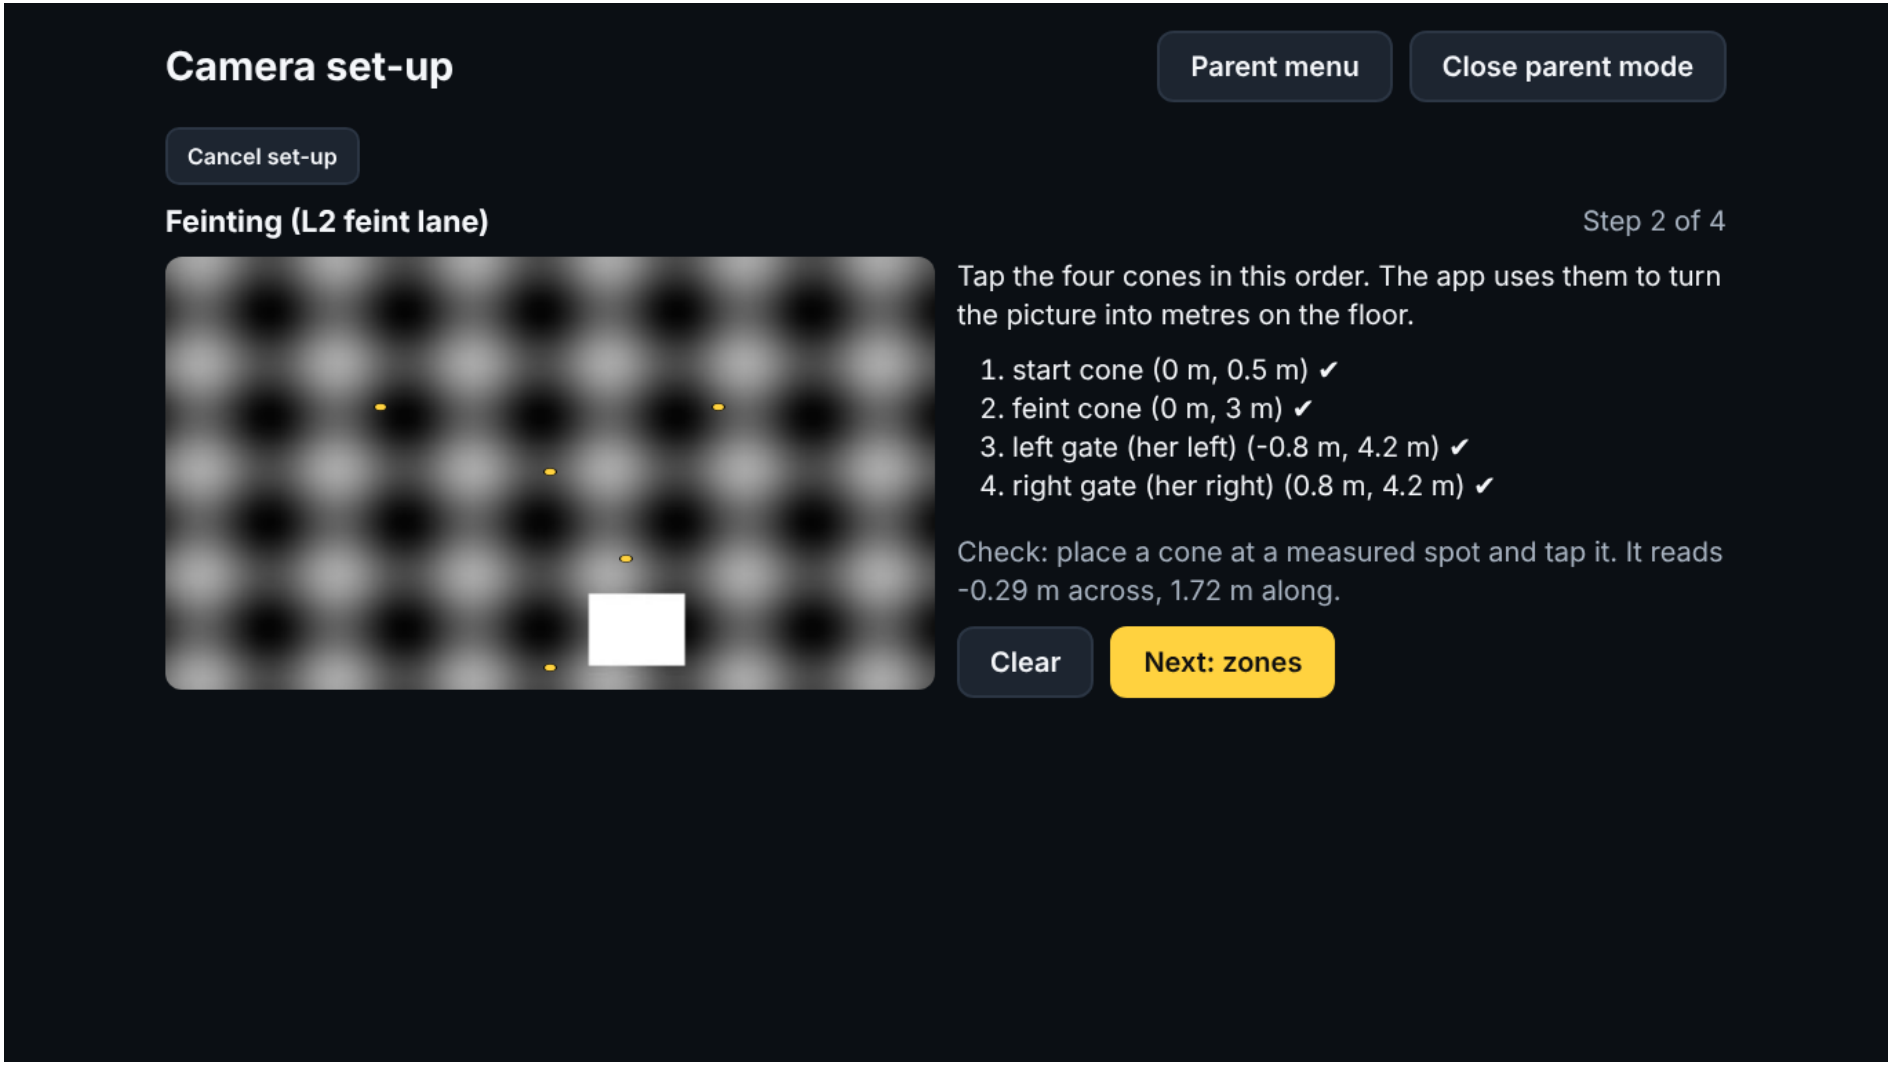

31. Reference photo

The parent mounts the webcam where the drill needs it and takes a reference photo with the lane empty. Every session's framing check compares against it.

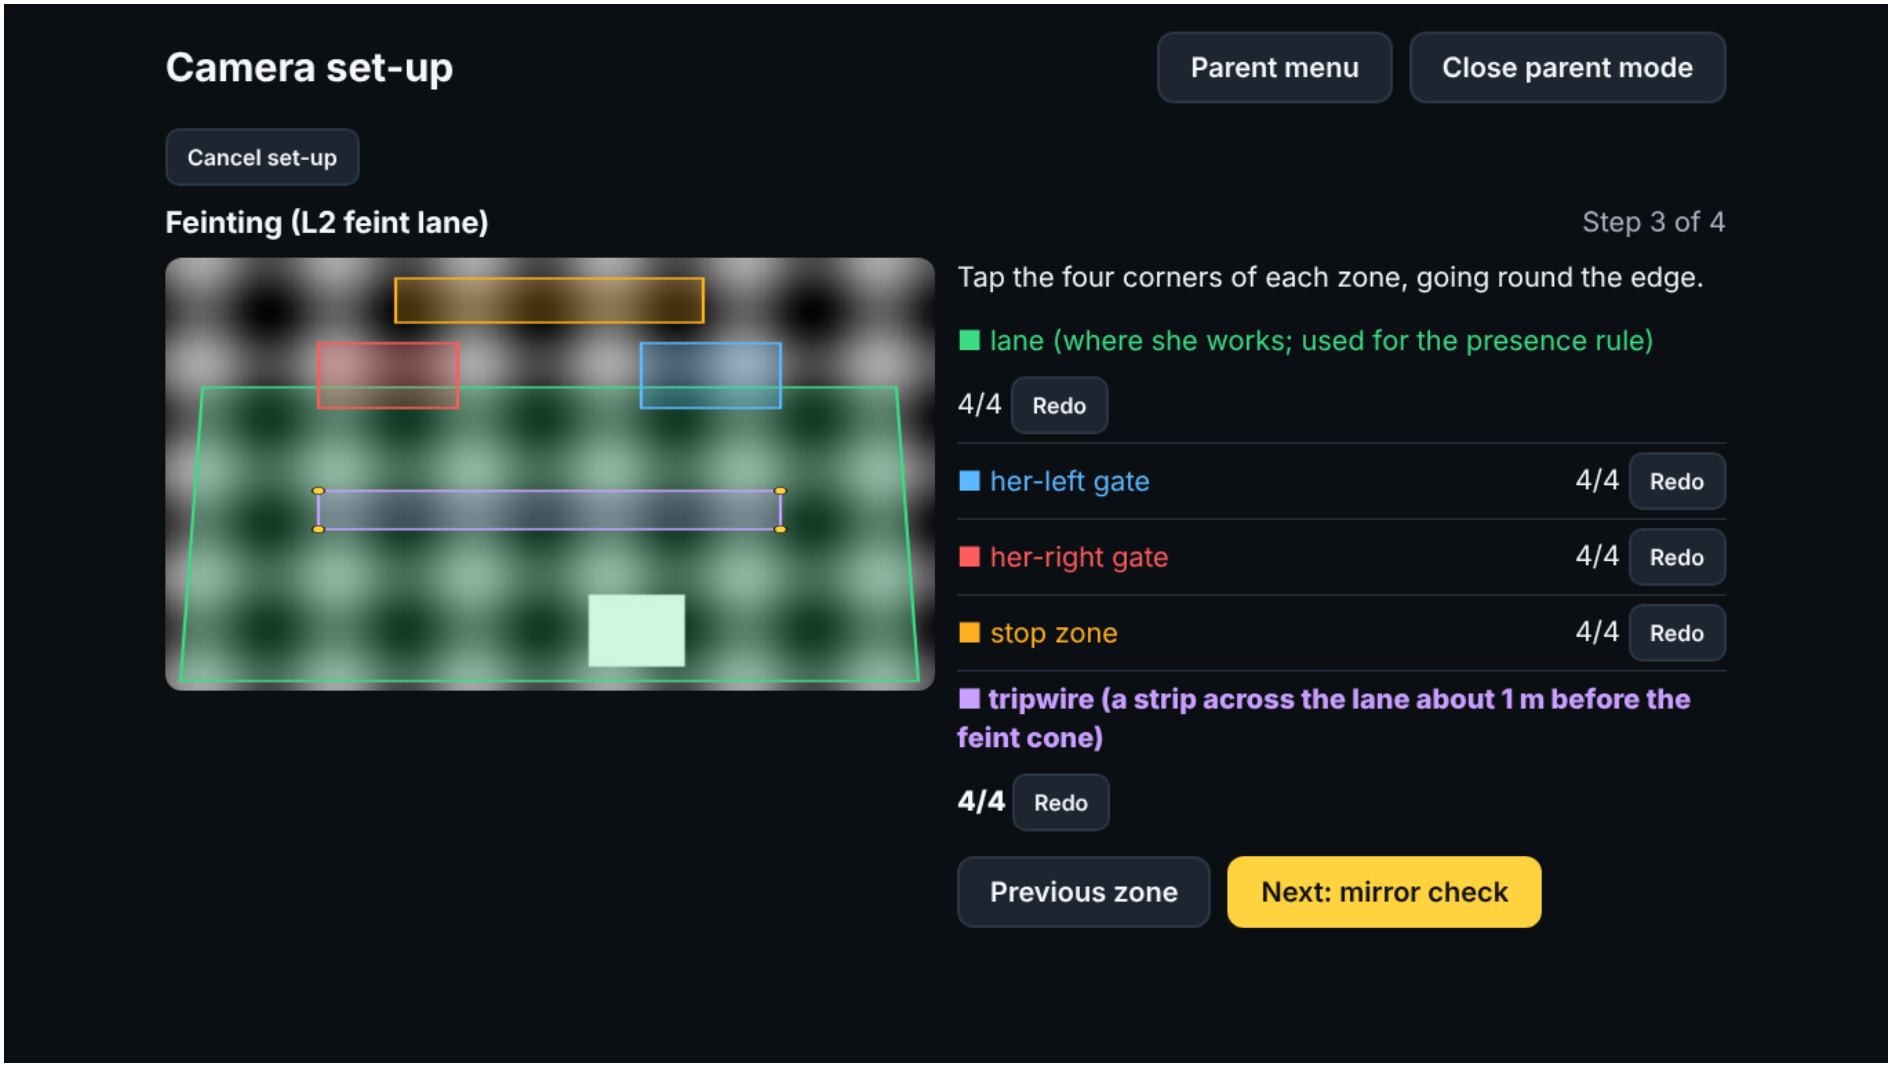

32. Floor calibration

The parent taps four cones in order, and the app maps the picture to metres on the floor; tapping any point reads back its position. (The new plan replaces this metric calibration with a room profile of furniture anchors and a safe-floor area.)

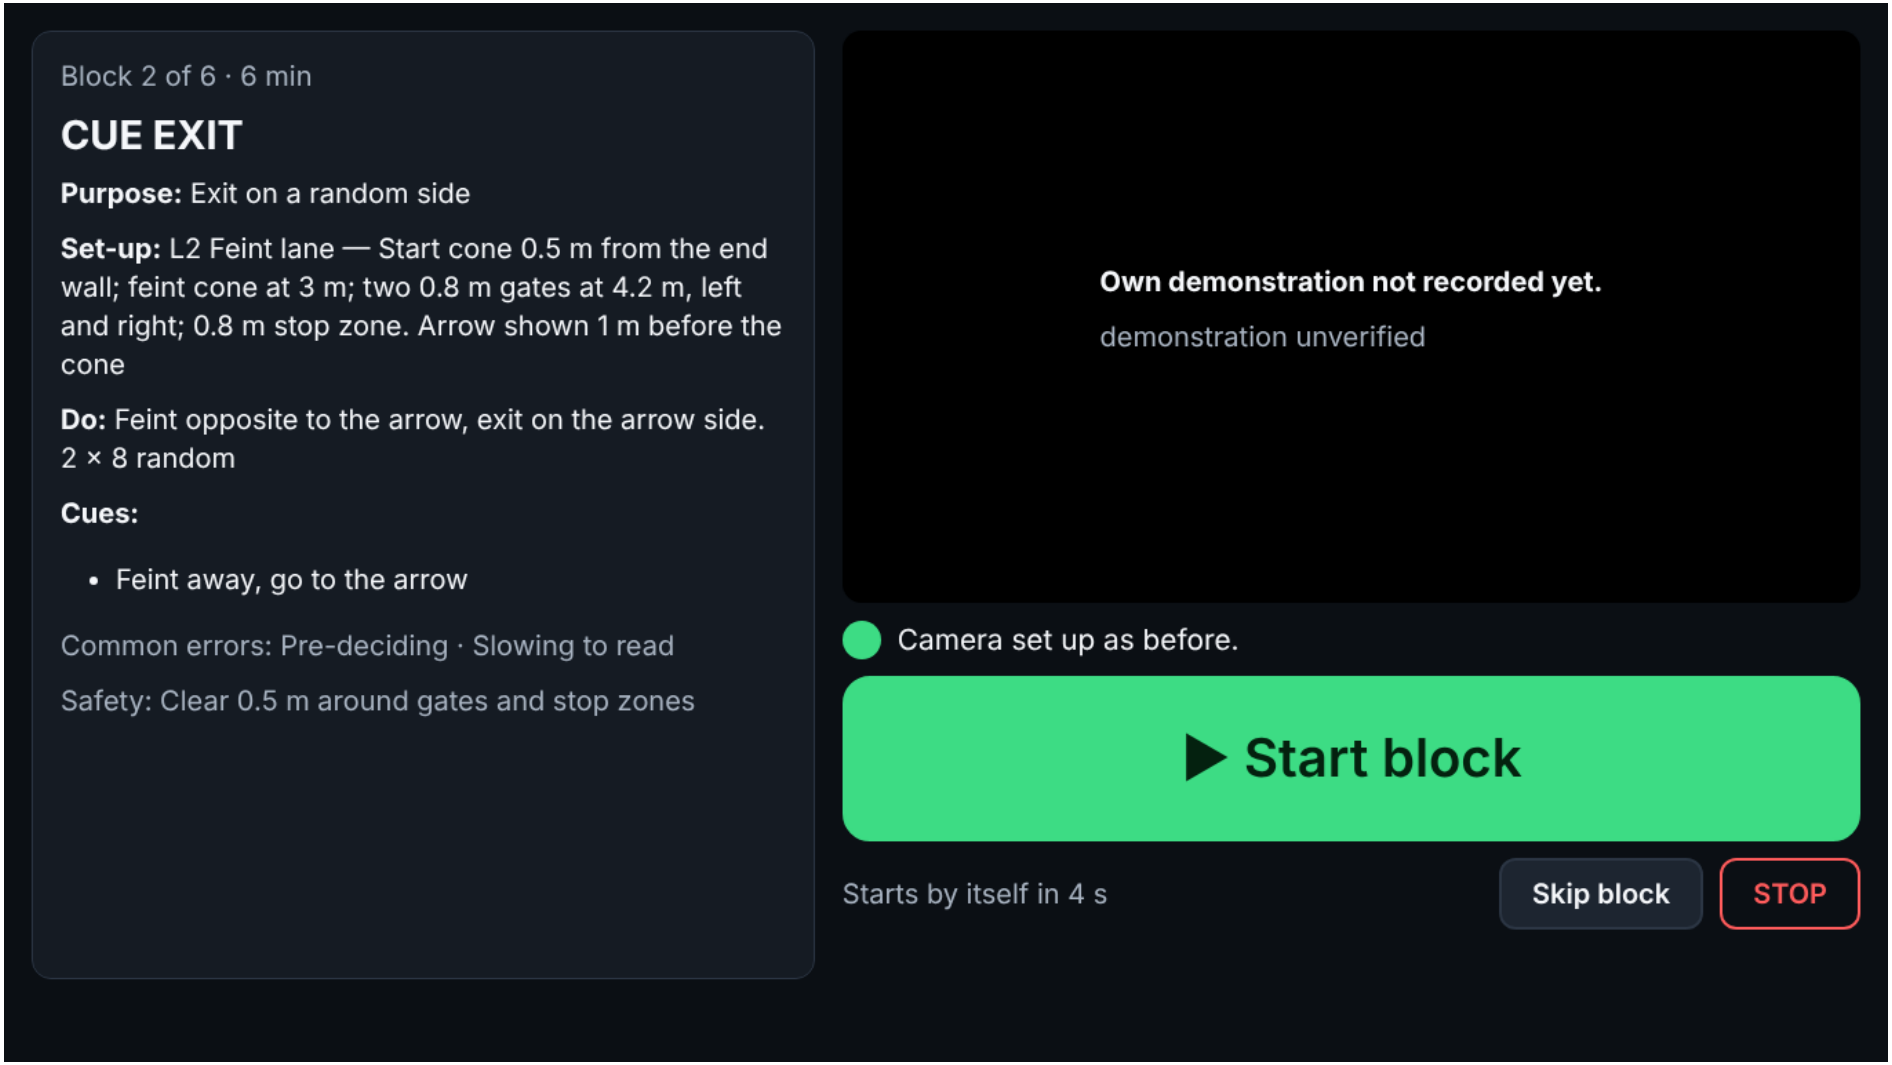

33. Zones and tripwire

The parent outlines the drill area, the player's left and right gates, the stop zone and the tripwire strip. The tripwire triggers the cue; the zones detect gate passage and whether anyone is in the lane.

34. Framing check

While the demo view is up, the app checks the camera against the reference photo: a green light, or red with a one-line fix such as "Camera has moved: tilt it up". The player never touches the camera.

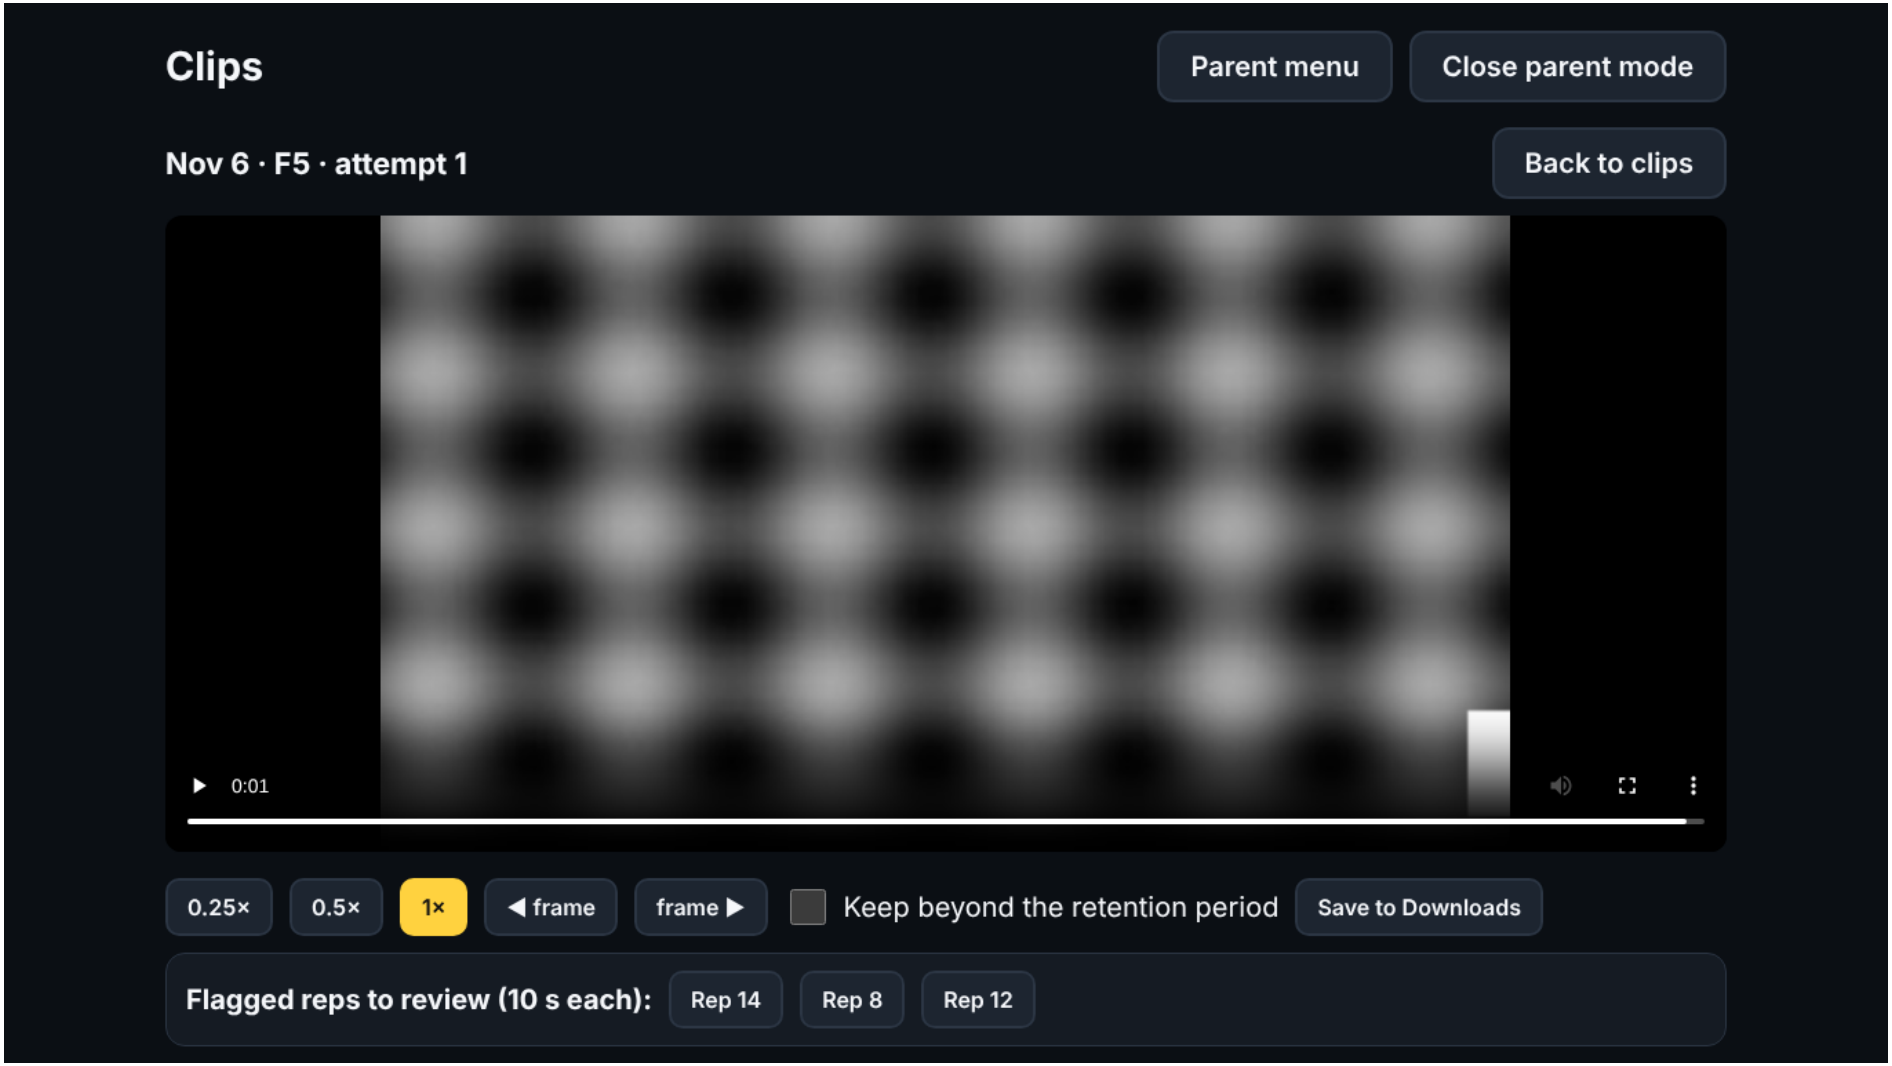

35. Recording a cue block

The red dot shows the block is being recorded. The cue appears a short random delay after the player crosses the tripwire.

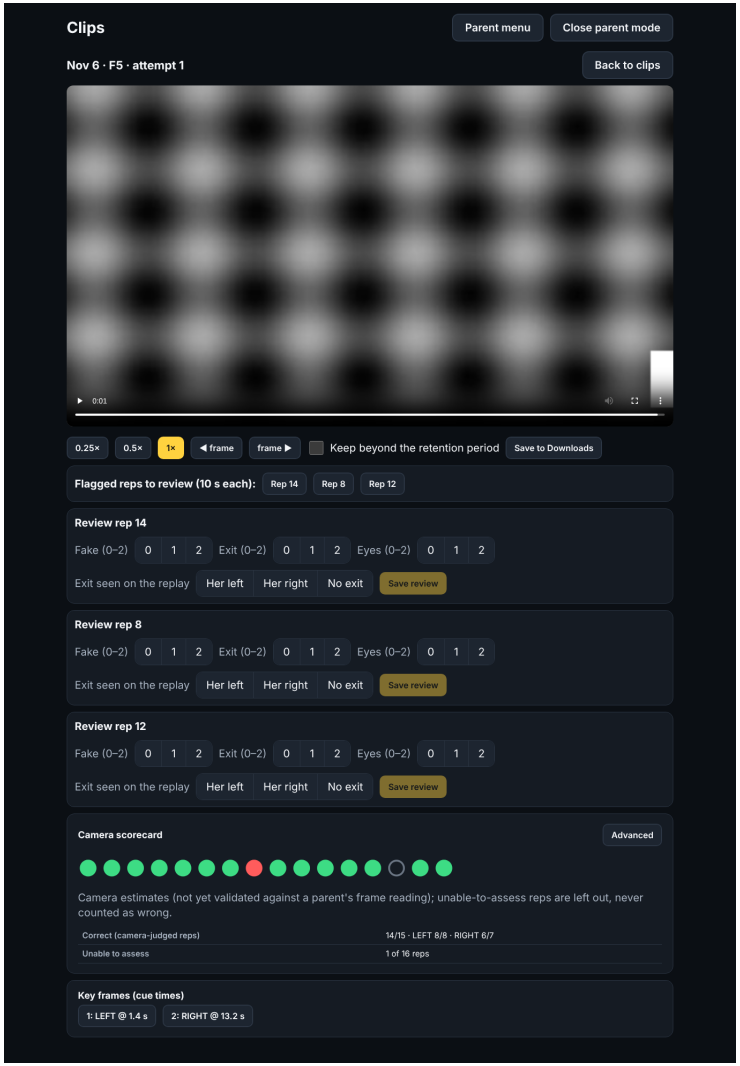

36. Clip player

Replay at quarter, half or normal speed, frame by frame, with keep, save and delete.

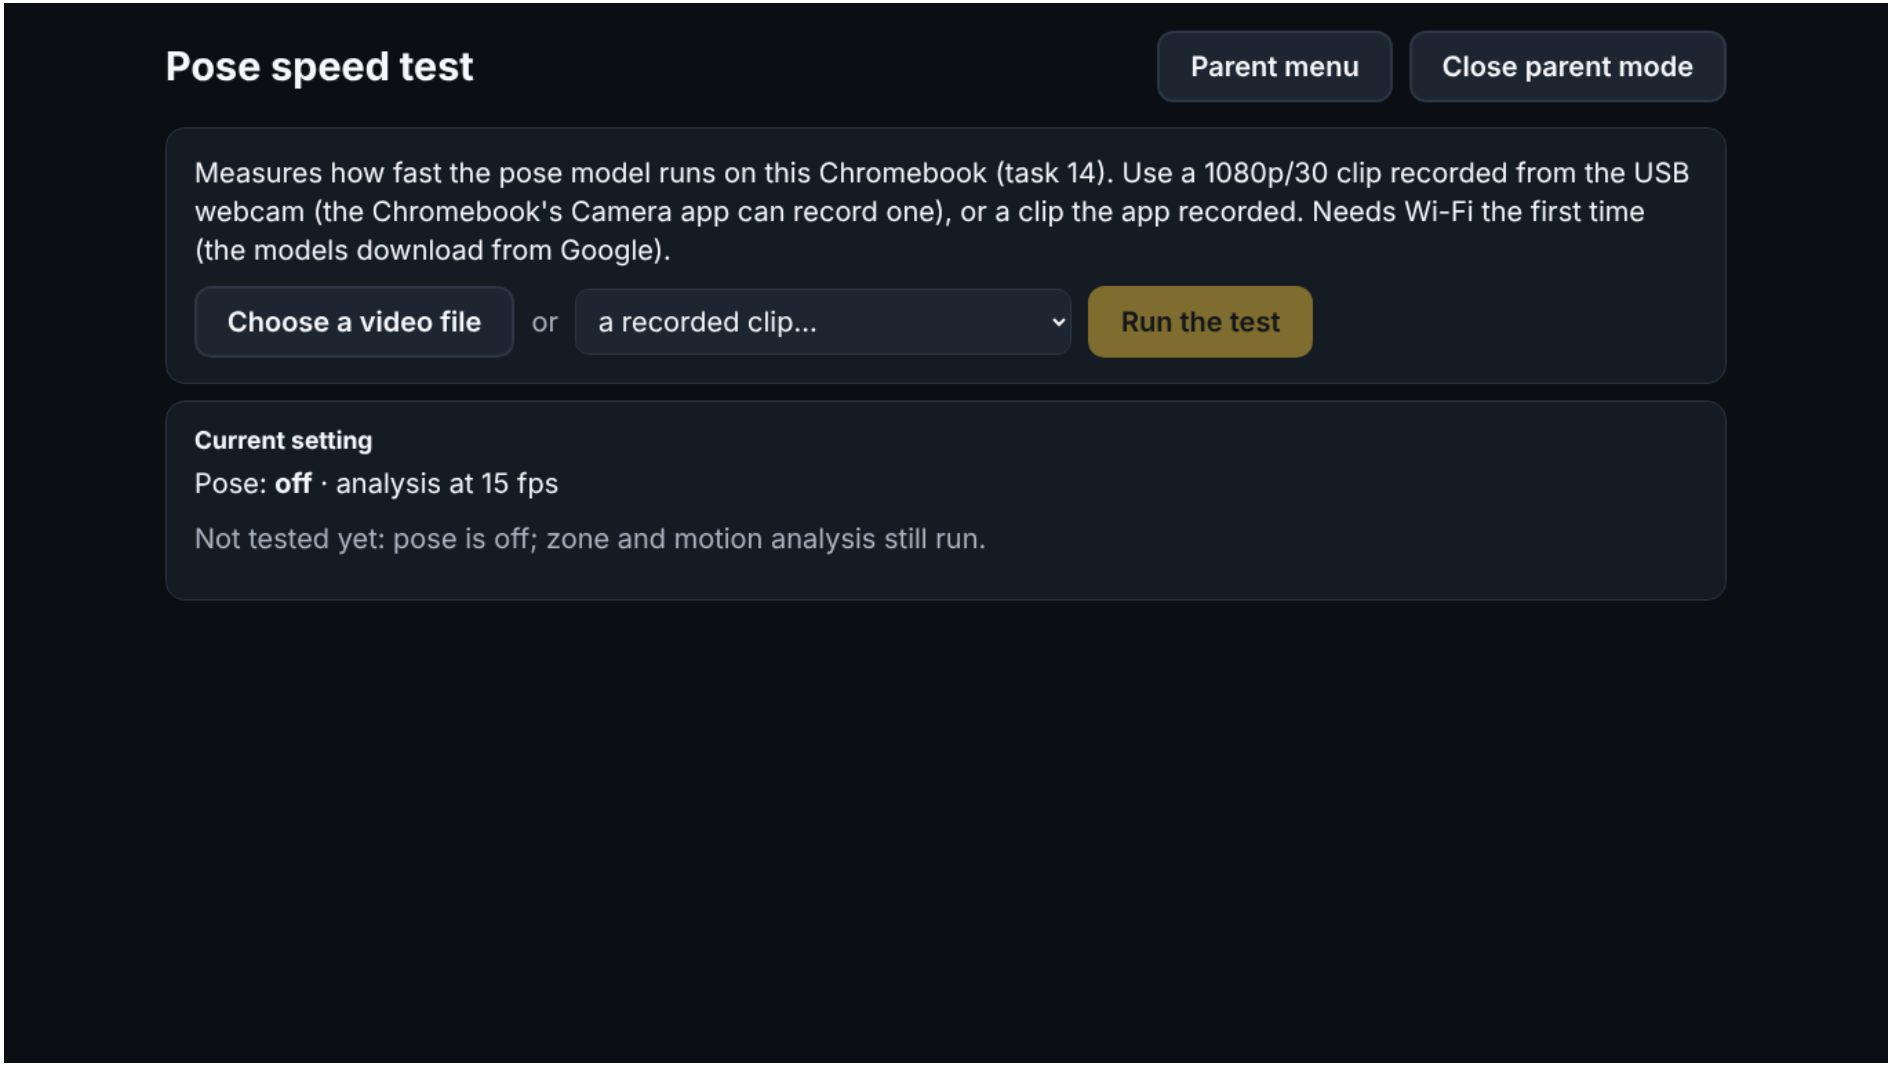

37. Scorecard, flagged reps and review

After each recorded block a background worker analyses the clip. The scorecard is Basic by default (right responses, change of mind, time to the right exit with its uncertainty, unable-to-assess count, one weaker-link sentence) with an Advanced toggle. Up to three flagged reps can be reviewed with a 0–2 rubric; reviews are the only labels learning may use. Sample numbers; all camera measures are estimates until validated.

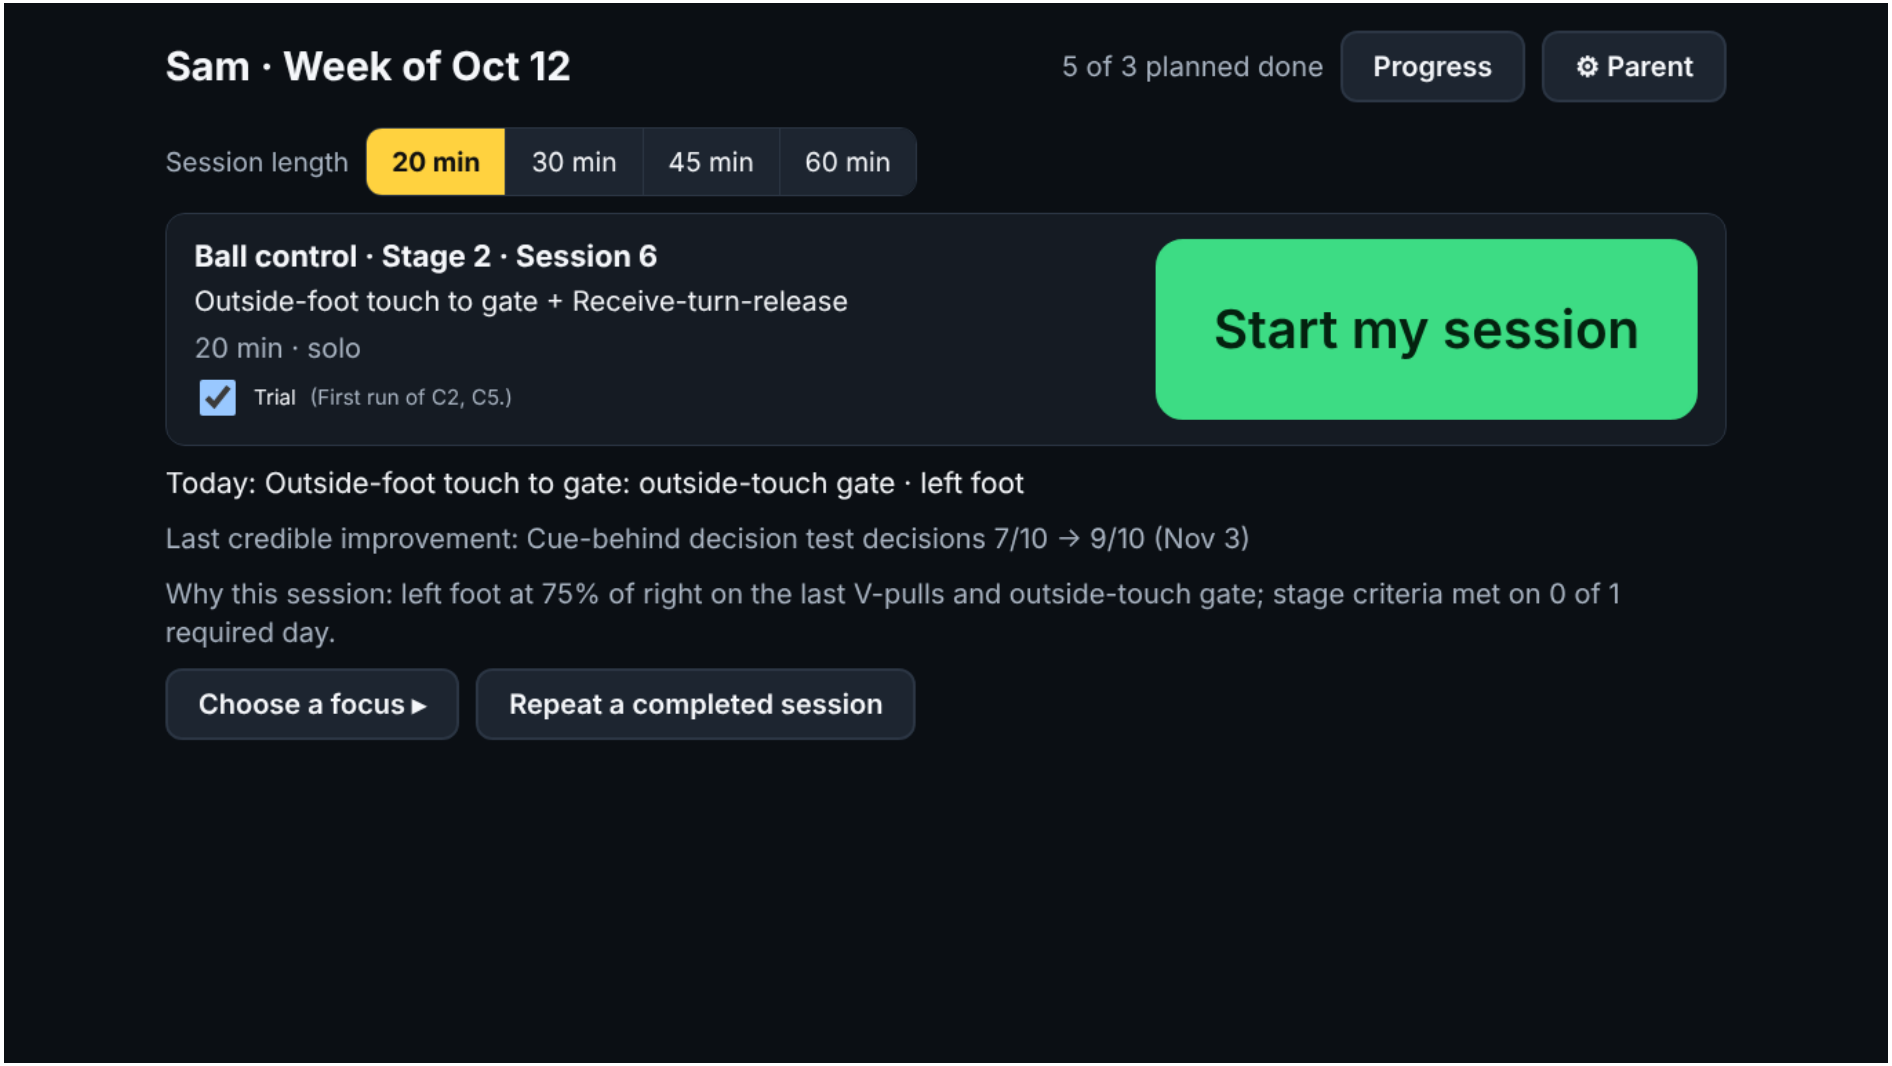

38. Pose speed test

Measures how fast the pose model runs on this Chromebook and chooses the analysis mode: native rate, 15 fps, or zones and motion only.

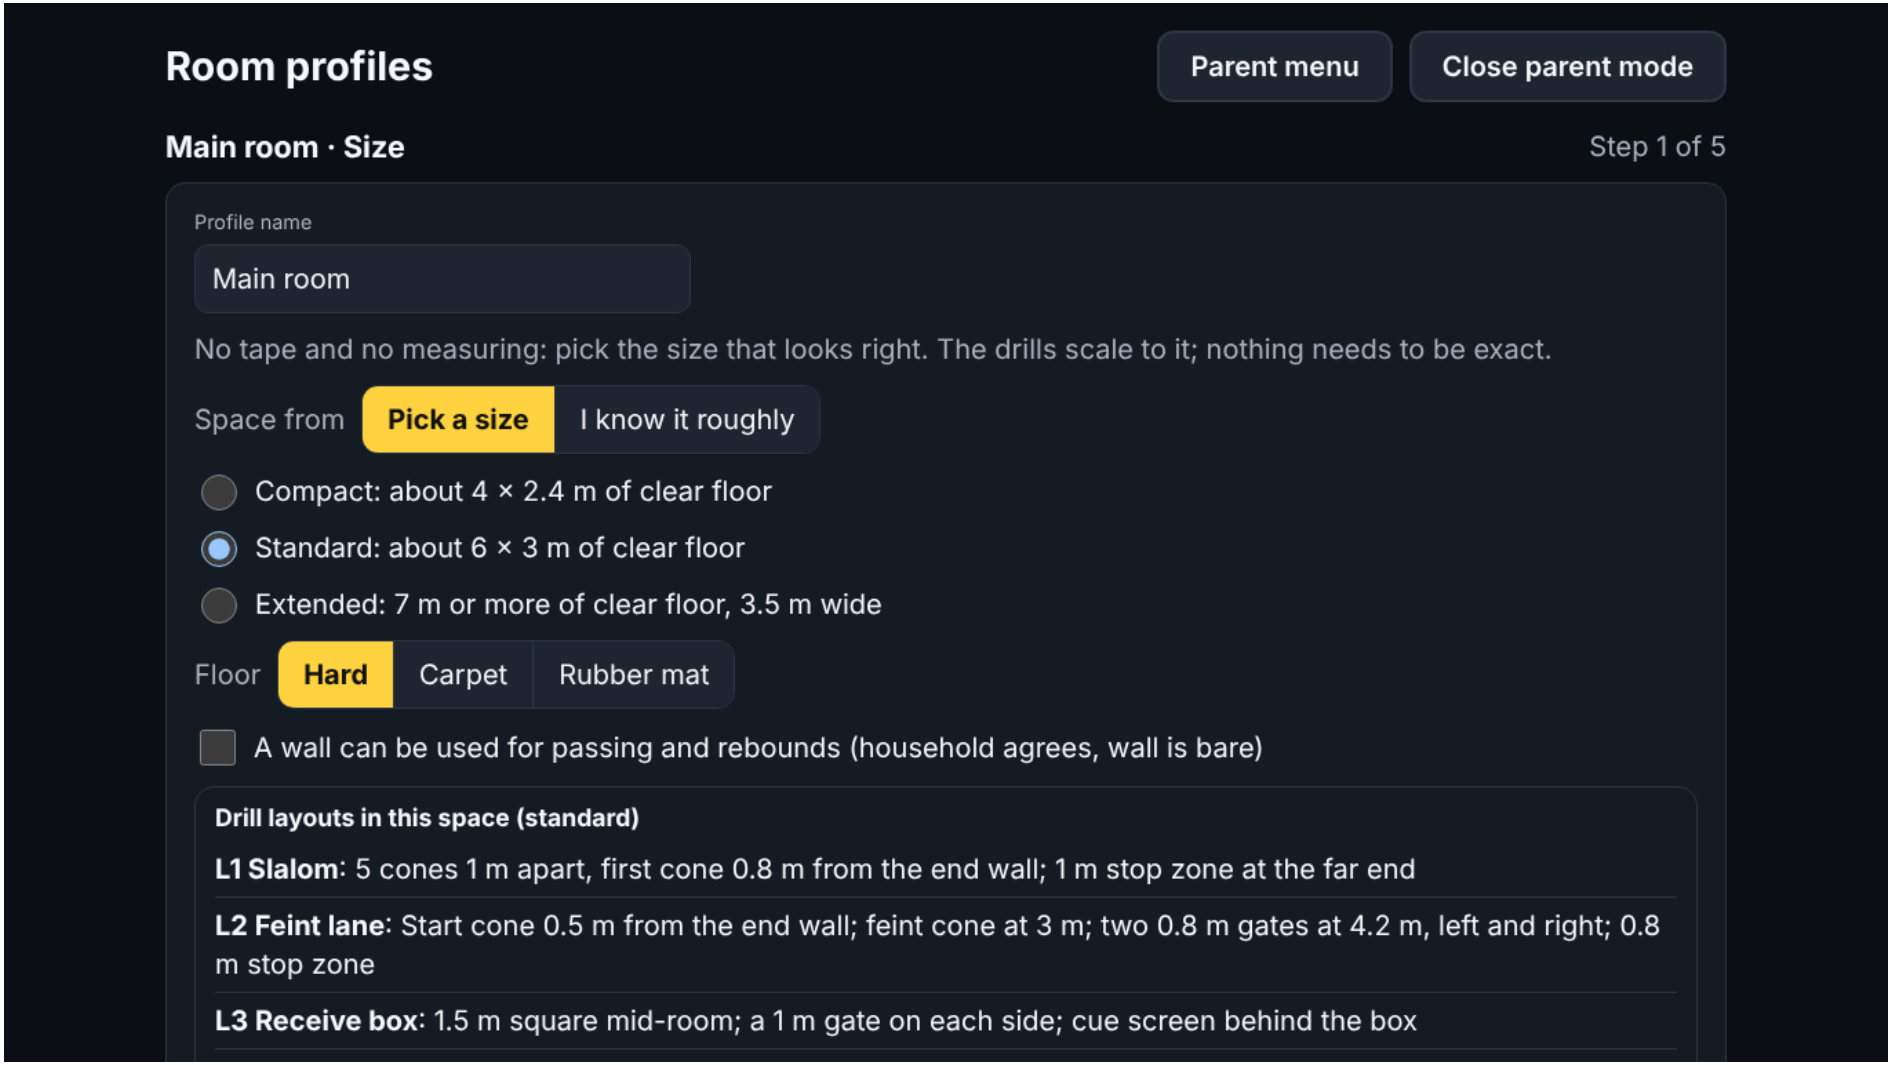

39. Home · Start my session

One tap starts the recommended session; 20/30/45/60 minutes; goals for today; last credible improvement; why this session; Choose a focus for everything else.

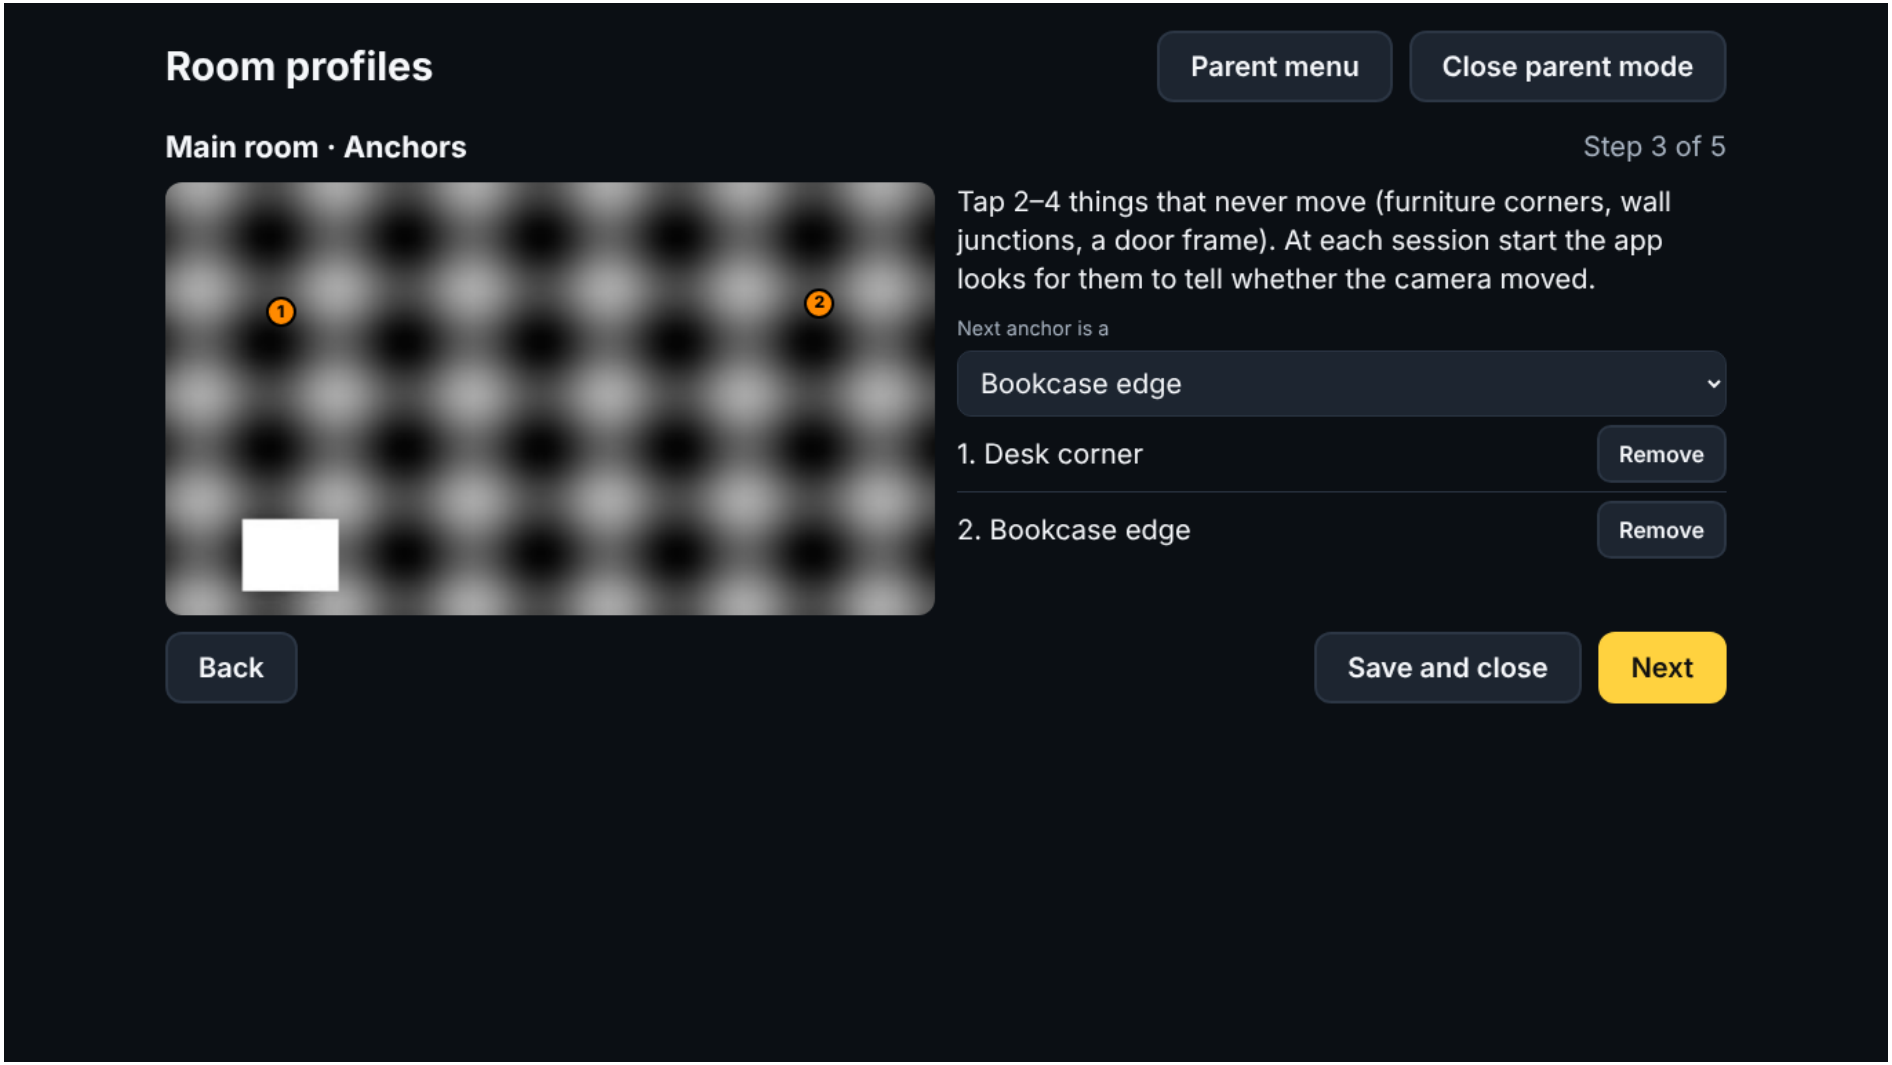

40. Room profile · size

Pick a size, use the safe floor drawn on the photo, or enter rough dimensions. Floor type and wall use. Each layout shows whether it fits the space.

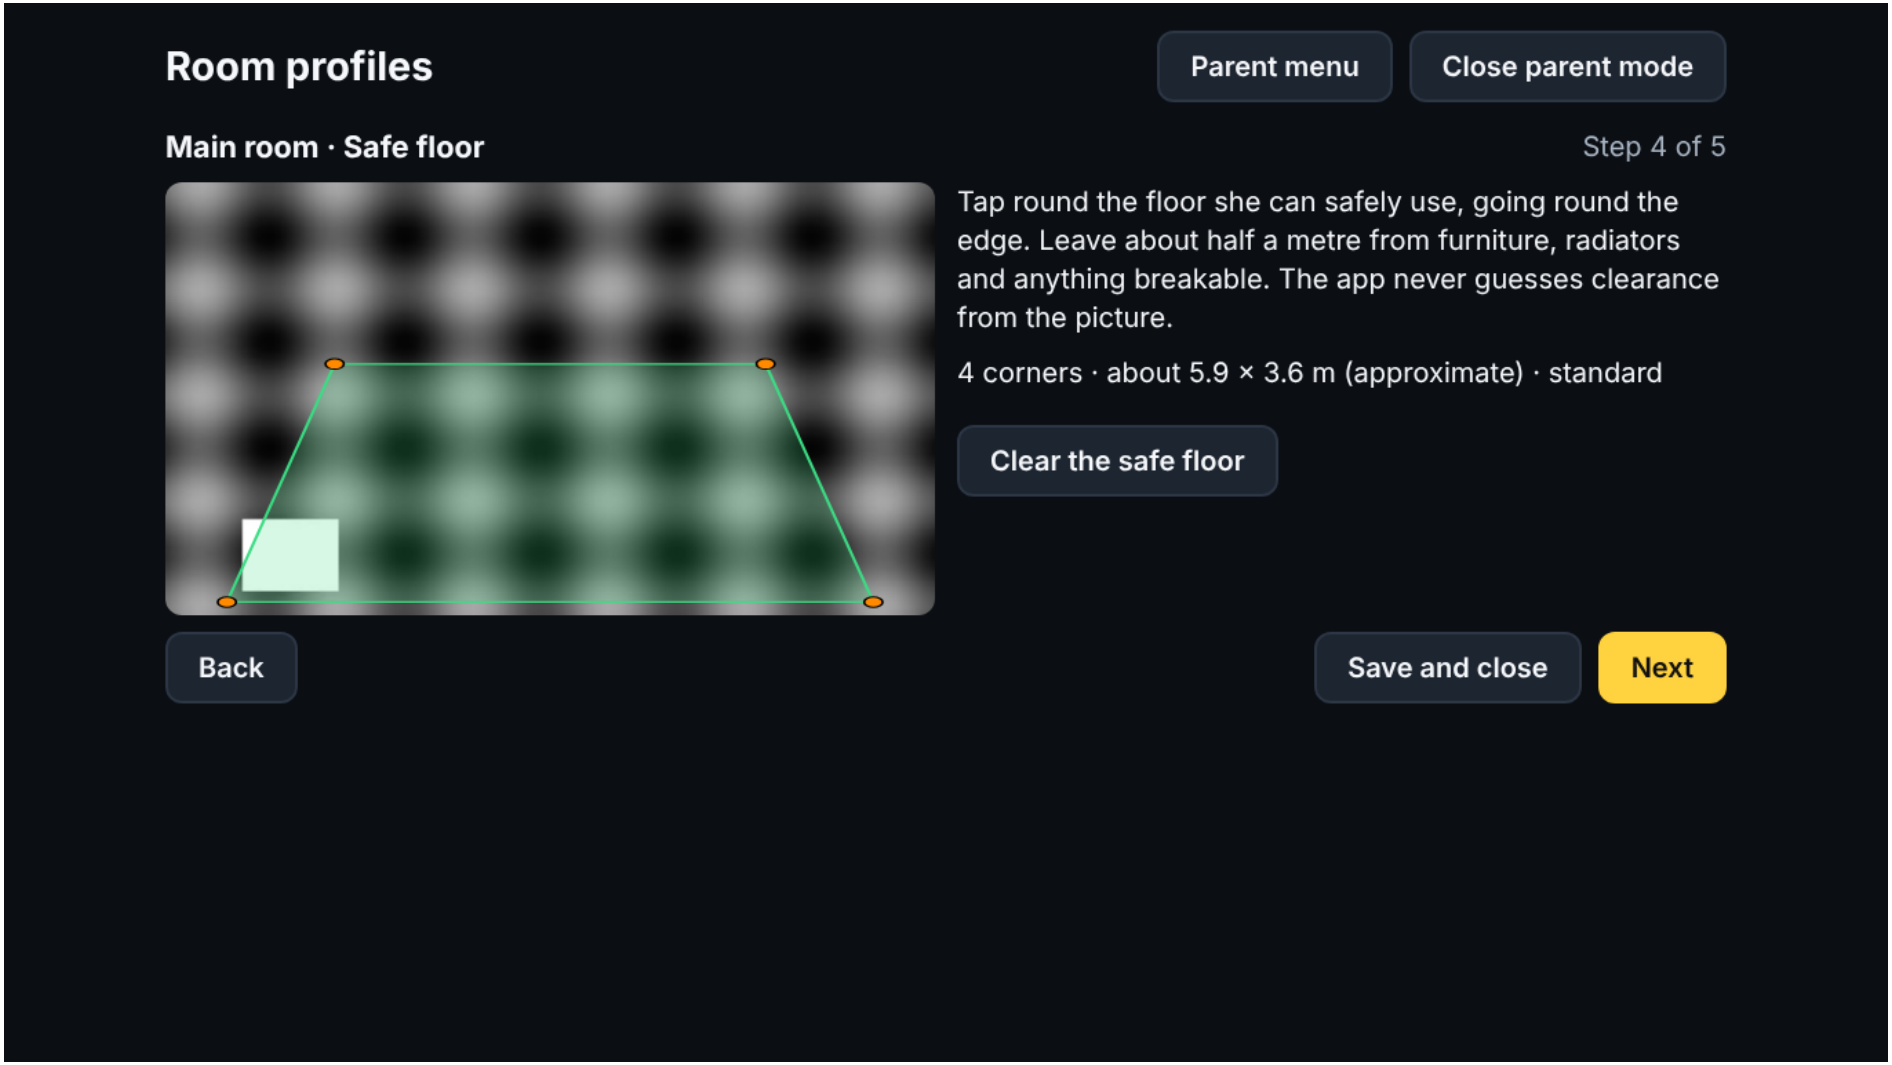

41. Room profile · anchors

On the saved camera photo the parent taps a few things that never move (desk corner, bookcase edge). At each session start the app looks for them: matched, partly hidden (lower confidence) or moved (the session runs camera-unverified).

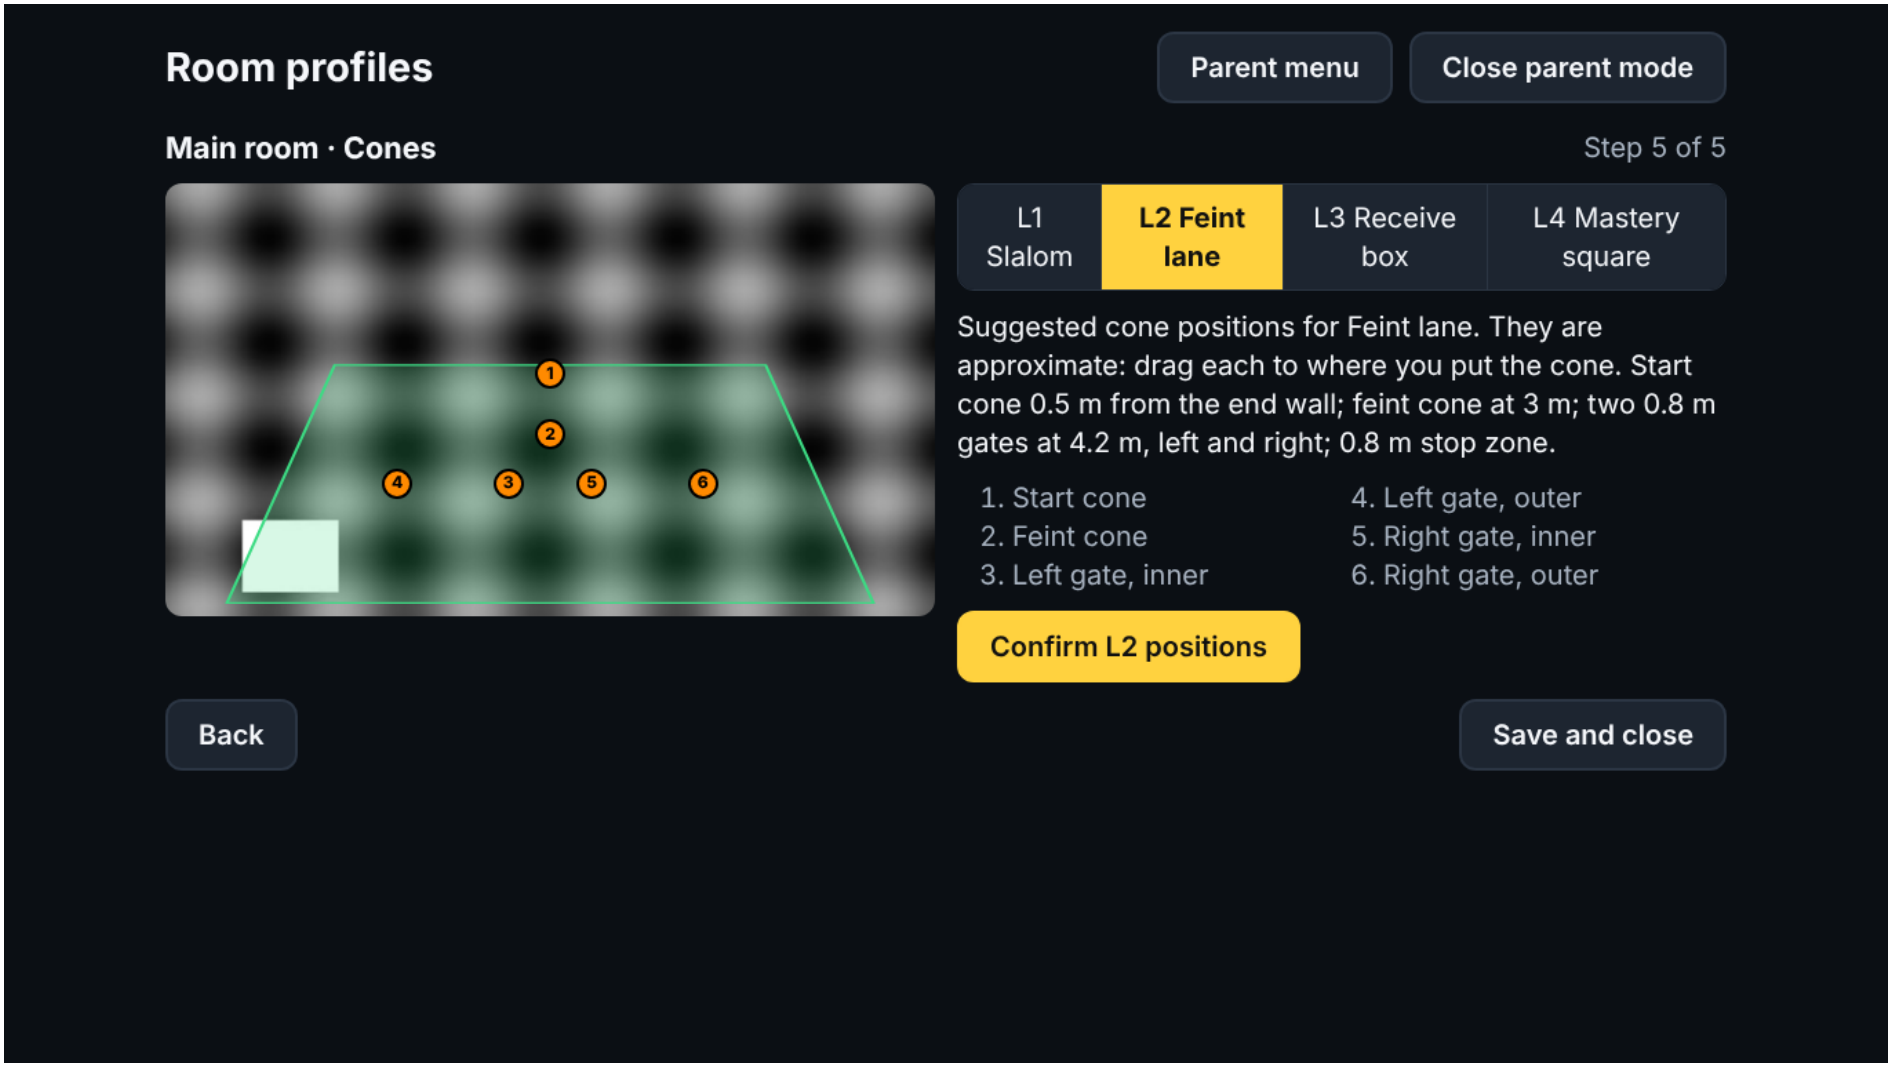

42. Room profile · safe floor

The parent taps round the floor that is safe to use, leaving space from furniture. The app never guesses clearance from the picture; drills that need more space are refused.

43. Room profile · cone overlay

Suggested cone positions for each layout over the photo. They are approximate and can be dragged to where the cones really are; confirming saves them for the demo view.

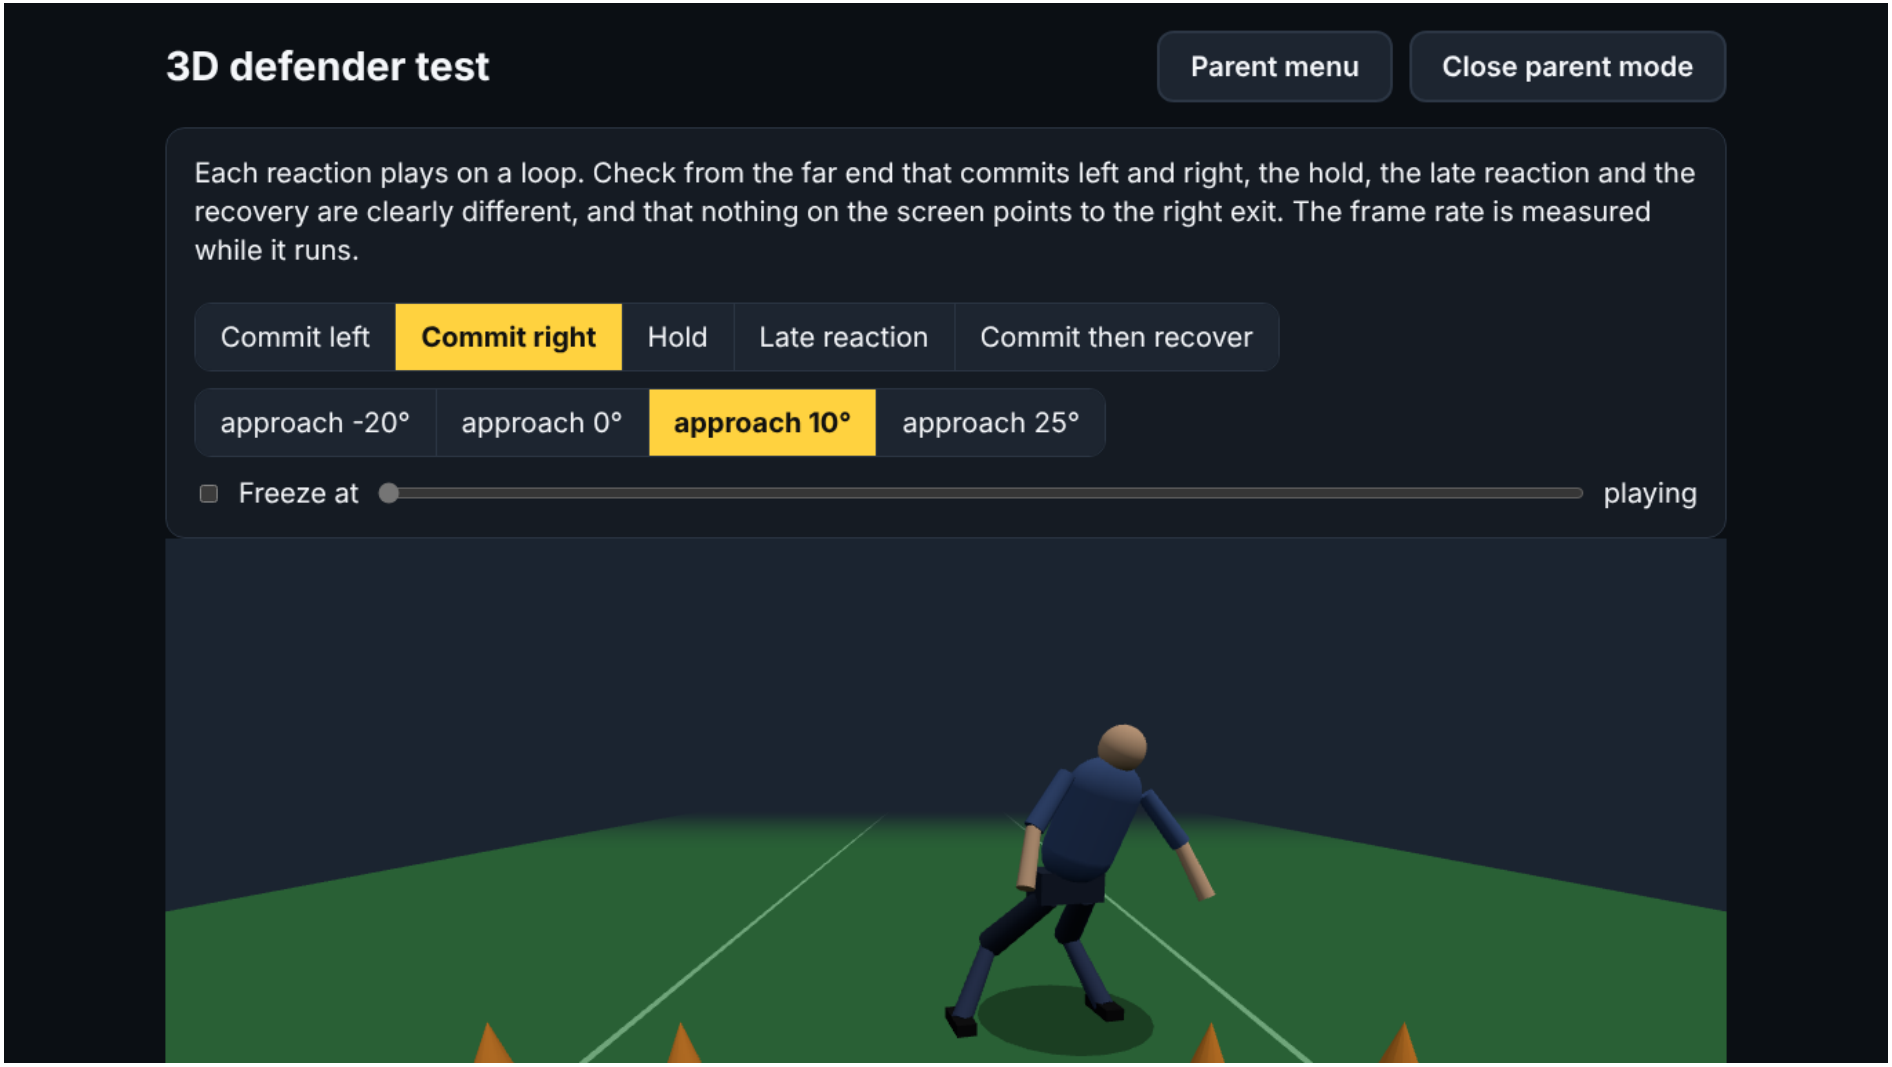

44. Defender block

The scored reactive drill view: a 3D defender seen from the player's eyes approaches at a varied angle and speed, then reacts (here, holding square in front). The reaction comes from a seeded engine whose odds are game-design parameters, not a model of real defenders; the right exit is judged against the final position. Both gates look the same; nothing on screen shows the right exit.

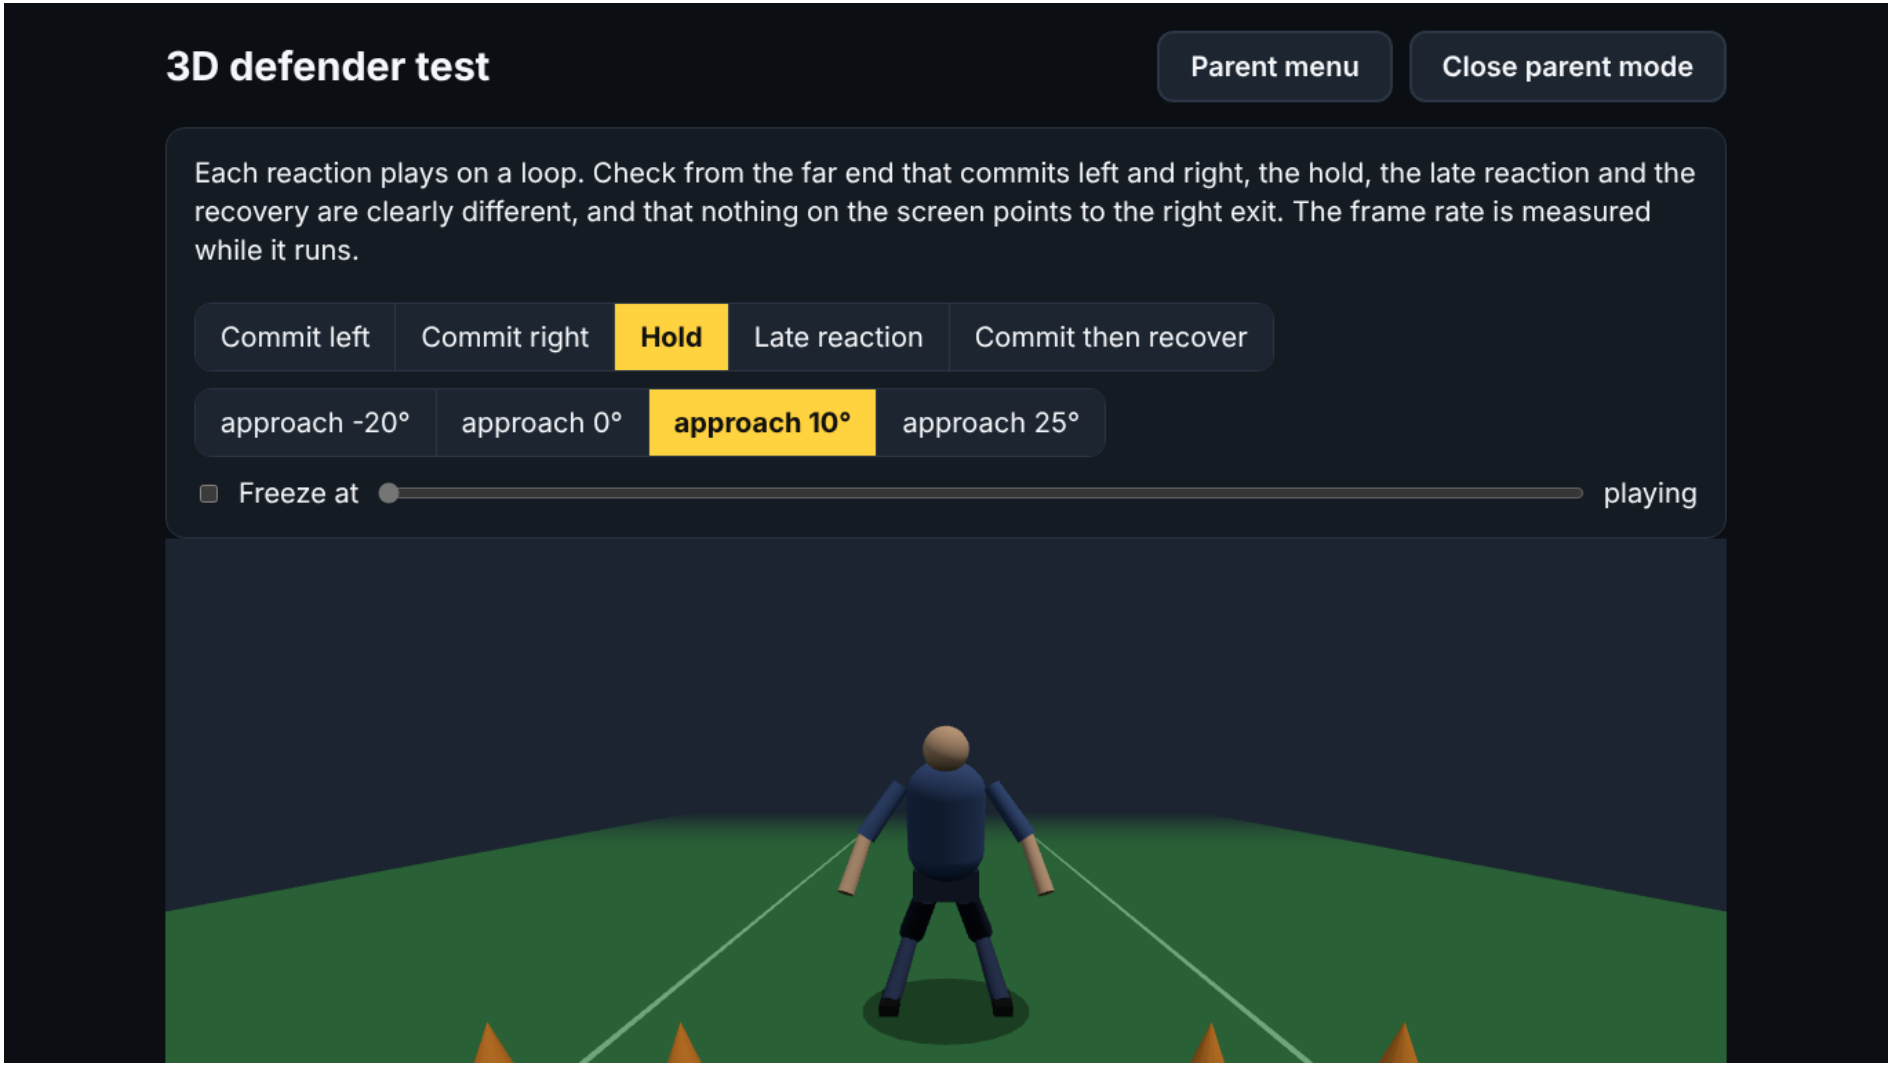

45. Parent · 3D defender test (commit)

Each reaction on a loop for a check from the far end, with the frame rate measured and saved. Below it, the archetype odds table.

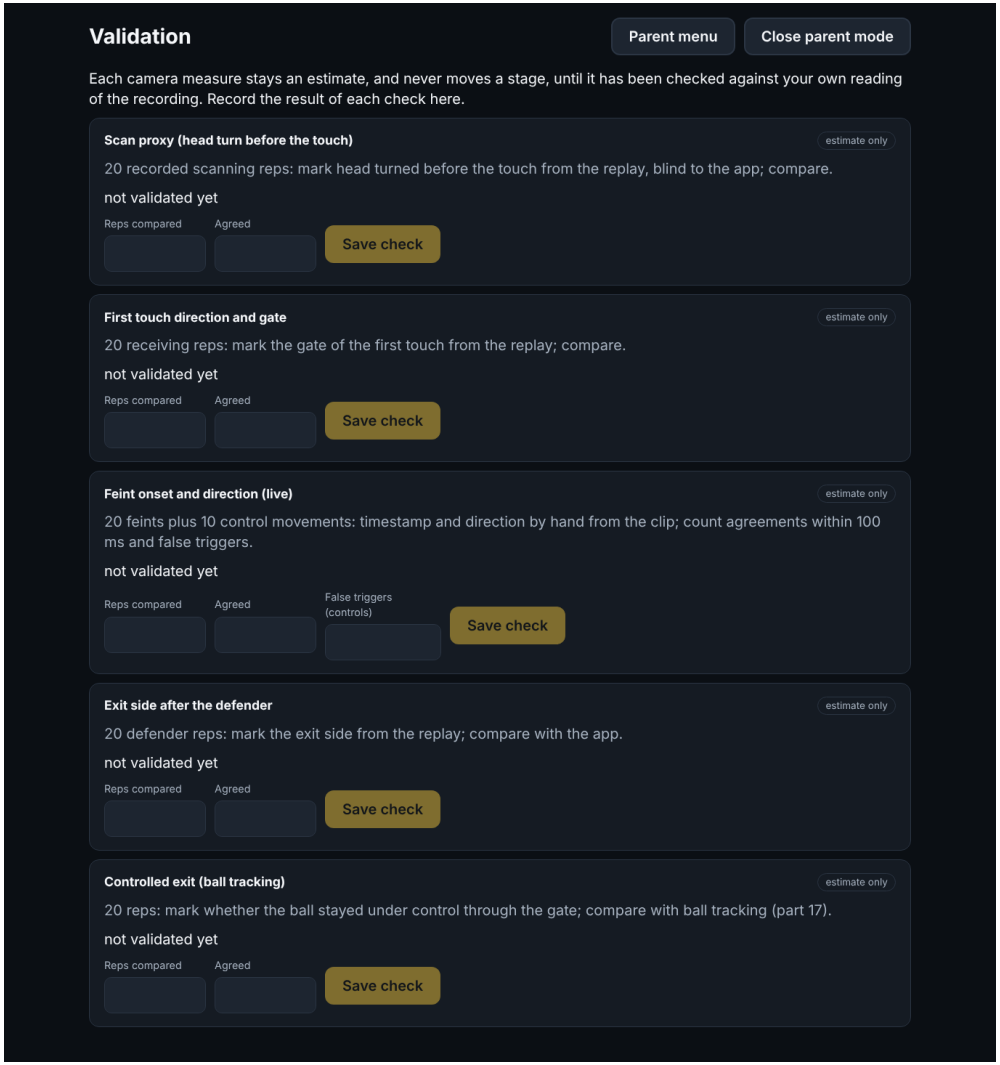

46. Parent · 3D defender test (hold)

A hold: square, a small drop and half-step back, no lateral move.

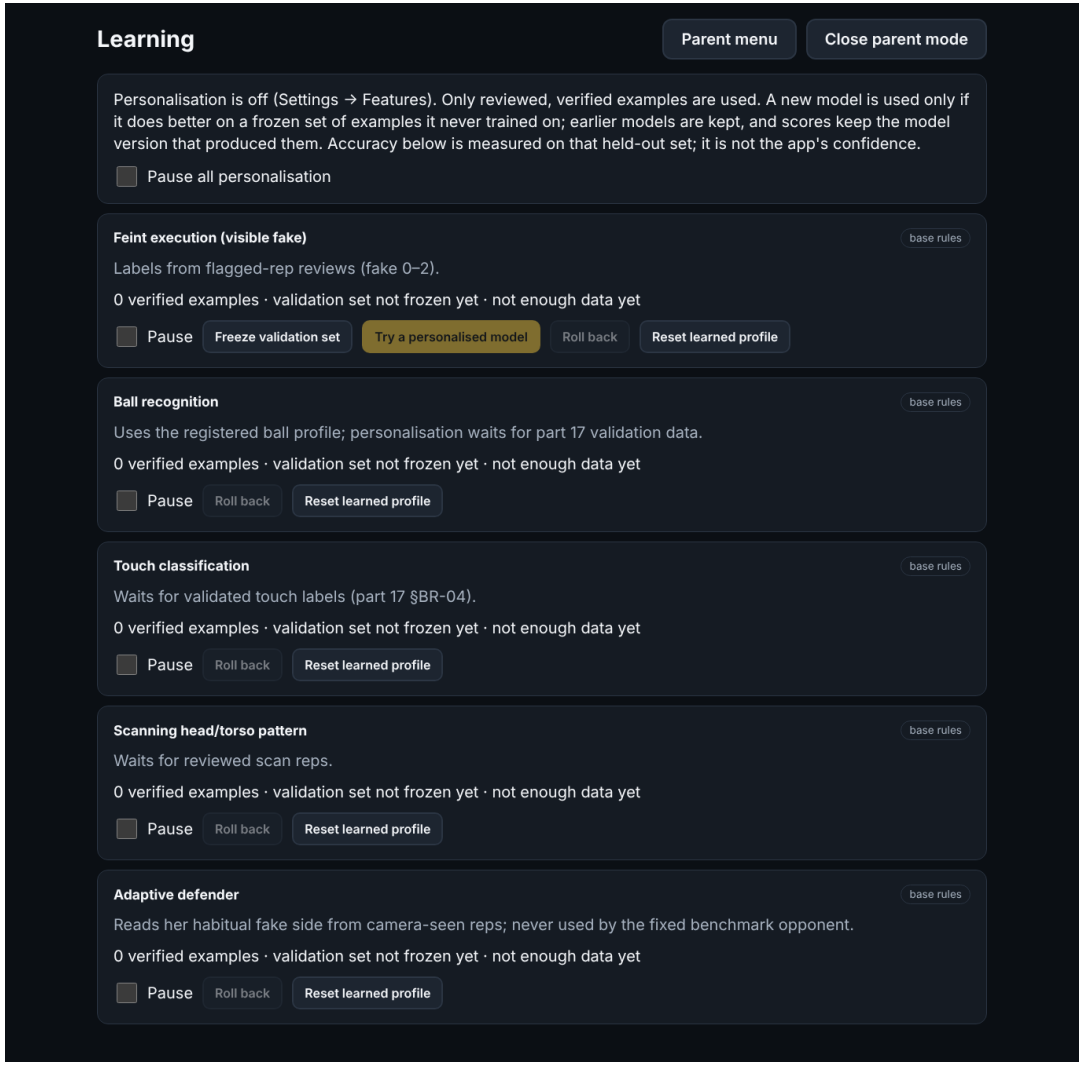

47. Parent · Validation

Each camera measure (scan proxy, first touch, feint onset, exit side, controlled exit) stays an estimate until the parent compares it with their own reading of 20 or more recorded reps.

48. Parent · Learning

Personalisation status per component: verified examples, the frozen validation set, model versions with held-out accuracy, and pause, reset and roll back. Nothing is re-scored.

49. Defender positions

The positions the 3D defender shows, frozen at exact moments with the test screen's freeze slider: approach from the left and right, stance while reading, commit left and right, hold, late reaction, and commit then recover.

50. Parent · Ball registration

Tap the ball in the live picture (still, rolling, near, far). The app learns its colour and size, checks it against the room's background and shows live where it finds the ball.
